CHAPTER 1

MA 553 Spring 2016

This is material from the course MA 533 as it was taught in the spring of 2016.

1.1 Homework

Most of the homework is Ulrich original (or as original as elementary exercises in abstract algebra can be). However, an excellent resource and one that I will often quote on these solutions is [3]. Other resources include [1] and (to a lesser extent) [2]. I may also cite Milne's *Group Theory*, *Field Theory*, and *Commutative Algebra: A Primer* notes, respectively, [4], [5], and (no reference for the last).

$\mathbb{R}$	is the set of real numbers
$\mathbb{C}$	is the set of complex numbers
$\mathbb{Q}$	is the set of rational numbers
$\mathbb{F}_q$	is the finite field of order $q = p^n$ for some prime p
$\mathbb{Z}$	is the set of the integers
$\mathbb{N}$	is the set of the natural numbers $1, 2, ...$
$\Bbbk$	is used to denote the base field with characteristic $\operatorname{char} \Bbbk$
$\mathbb{K}, \mathbb{E}, \mathbb{L}$	is used to denote field extensions over the base field $\Bbbk$
C_n	is the cyclic group of order n not necessarily equal (but isomorphic) to $\mathbb{Z}/p\mathbb{Z}$
S_n	is the symmetric group on $\{1, \dots, n\}$
A_n	is the alternating group on $\{1, \dots, n\}$
D_n	is the dihedral group of order n
$A \setminus B$	is the set difference of A and B, that is, the complement of $A \cap B$ in A
$X \simeq Y$	means X and Y are isomorphic as groups, rings, R-modules, or fields

Homework 1

Problem 1. Let G be a group, $a \in G$ an element of finite order m, and n a positive integer. Prove that

$$|a^n| = \frac{m}{\gcd(m,n)}.$$

Proof. Without loss of generality, we may assume $n < m$; otherwise, by the fundamental theorem of arithmetic, there exist q and r with $r < m$ such that $n = qm + r$ so $a^n = a^{qm+r} = a^{qm}a^r = a^r$. ■

Problem 2. Let G be a group, and let a, b be elements of finite order m, n respectively. Show that if $ba = ab$ and $\langle a \rangle \cap \langle b \rangle = \{e\}$, then $|ab| = \operatorname{lcm}(m,n)$.
