1 McClure's 571 Problems

1.1 Midterm I (Fall 2015)

Problem 1.1.1. Let $A \subset X$ and $B \subset Y$. Show that the space $X \times Y$,

$$\overline{A \times B} = \overline{A} \times \overline{B}.$$

Proof. ■

Problem 1.1.2. Let X be a topological space and let A be a dense subset of X . Let Y be a Hausdorff space and let $g, h: X \rightarrow Y$ be continuous functions which agree on A . Prove that $g = h$.

Proof. ■

Problem 1.1.3. Let X and Y be topological spaces and let $f: X \rightarrow Y$ be a continuous function. Let G_f (called the *graph* of f) be the subspace $\{x \times f(x) \mid x \in X\}$ of $X \times Y$. Prove that if Y is Hausdorff then G_f is closed.

Proof. ■

Problem 1.1.4. Let X be a topological space and let $f, g: X \rightarrow \mathbf{R}$ be continuous. Define $h: X \rightarrow \mathbf{R}$ by

$$h(x) = \min\{f(x), g(x)\}.$$

Use the pasting lemma to prove that h is continuous. (You will not get full credit for any other method.)

Proof. ■

Problem 1.1.5. Let X and Y be topological spaces and let $f: X \rightarrow Y$ be a function with the property that

$$f(\overline{A}) \subset \overline{f(A)}$$

for all subsets A of X . Prove that f is continuous.

Proof. ■

Problem 1.1.6. Let X and Y be topological spaces and let $f: X \rightarrow Y$ be a continuous function. Prove that

$$f(\overline{A}) \subset \overline{f(A)}$$

for all subsets A of X .

Proof. ■

Problem 1.1.7. Let X be any topological space and let Y be a Hausdorff space. Let $f, g: X \rightarrow Y$ be continuous functions. Prove that the set $\{x \in X \mid f(x) = g(x)\}$ is closed.

Proof. ■

Problem 1.1.8. Let X be a topological space and A a subset of X . Suppose that

$$A \subset \overline{X \setminus A}.$$

Prove that \overline{A} does not contain any nonempty open set.

Proof. ■

Problem 1.1.9. Let X be a topological space with a countable basis. Prove that every open cover of X has a countable subcover.

Proof. ■

Problem 1.1.10. Let X_α be an infinite family of topological spaces.

- (a) Define the product topology on $\prod X_\alpha$.
- (b) For each α , let A_α be a subspace of X_α . Prove that $\overline{\prod A_\alpha} = \prod \overline{A_\alpha}$.

Proof. ■

Problem 1.1.11. Suppose that we are given an indexing set A , and for each $\alpha \in A$ a topological space X_α . Suppose also that for each $\alpha \in A$ we are given a point $b_\alpha \in X_\alpha$. Let $Y = \prod X_\alpha$ with the product topology. Let $\pi_\alpha: Y \rightarrow X_\alpha$ be the projection. Prove that the set

$$S = \{y \in Y \mid \pi_\alpha(y) = b_\alpha \text{ except for finitely many } \alpha\}$$

is dense in Y (that is, its closure is Y).

Proof. ■

Problem 1.1.12. Let X be the Cartesian product $\mathbf{R}^\omega = \prod_{i=1}^\infty \mathbf{R}$ with the box topology (recall that a basis for this topology consists of all sets of the form $\prod_{i=1}^\infty U_i$, where each U_i is open in \mathbf{R}). Let $f: \mathbf{R} \rightarrow X$ be the function which takes t to (t, t, t, \dots) . Prove that f is not continuous.

Proof. ■

Problem 1.1.13. Prove that the countable product \mathbf{R}^ω (with the product topology) has the following property: there is a countable family \mathcal{F} of neighborhoods of the point $\mathbf{0} = (0, 0, 0, \dots)$ such that for every neighborhood V of $\mathbf{0}$ there is a $U \in \mathcal{F}$ with $U \subset V$.

Note: the book proves that \mathbf{R}^ω is a metric space, but you may not use this in your proof. Use the definition of the product topology.

Proof. ■

Problem 1.1.14. Let X be the two-point set $\{0, 1\}$ with the discrete topology. Let Y be a countable product of copies of X , thus an element of Y is a sequence of 0's and 1's. For each $n \geq 1$, let $y_0 \in Y$ be the element $(1, 1, 1, \dots, 1, 0, 0, 0, \dots)$, with n 1's at the beginning and all other entries 0. Let $y \in Y$ be the element with all 1s. Prove that the set $\{y_n\}_{n \geq 1} \cup \{y\}$ is closed. Give a clear explanation. Do not use a metric.

Proof. ■

Problem 1.1.15. Let X be the two-point set $\{0, 1\}$ with the discrete topology. Let Y be a countable product of copies of X ; thus an element of Y is a sequence of 0's and 1's. Let A be the subset of Y consisting of sequences with only a finite number of 1's. Is A closed? Prove or disprove.

Proof. ■

Problem 1.1.16. Let Y be a topological space. Let X be a set and let $f: X \rightarrow Y$ be a function. Give X the topology in which the open sets are the sets $f^{-1}(V)$ with V open in Y (you do not have to verify that this is a topology). Let $a \in X$ and let B be a closed set in X not containing a . Prove that $f(a)$ is not in the closure of $f(B)$.

Proof. ■

Problem 1.1.17. Let $f: X \rightarrow Y$ be a function that takes closed sets to closed sets. Let $y \in Y$ and let U be an open set containing $f^{-1}(y)$. Prove that there is an open set V containing y such that $f^{-1}(V)$ is contained in U .

Proof. ■

Problem 1.1.18. Let X be a topological space with an equivalence relation \sim . Suppose that the quotient space X/\sim is Hausdorff. Prove that the set $S = \{x \times y \in X \times X \mid x \sim y\}$ is a closed subset of $X \times X$.

Proof. ■

Problem 1.1.19. Let $p: X \rightarrow Y$ be a quotient map. Let us say that a subset S of X is *saturated* if it has the form $p^{-1}(T)$ for some subset T of Y . Suppose that for every $y \in Y$ and every open neighborhood U of $p^{-1}(y)$ there is a saturated open set V with $p^{-1}(y) \subset V \subset U$. Prove that p takes closed sets to closed sets.

Proof. ■

Problem 1.1.20. Let X be a topological space, let D be a connected subset of X , and let $\{E_\alpha\}$ be a collection of connected subsets of X .

Proof. ■

Problem 1.1.21. Let X and Y be connected. Prove that $X \times Y$ is connected.

Proof. ■

Problem 1.1.22. For any space X , let us say that two points are “inseparable” if there is no separation $X = U \cup V$ into disjoint open sets such that $x \in U$ and $y \in V$. Write $x \sim y$ if x and y are inseparable. Then \sim is an equivalence relation (you don't have to prove this). Now suppose that X is locally connected (this means that for every point x and every open neighborhood U of x , there is a connected open neighborhood V of x contained in U). Prove that each equivalence class of the relation \sim is connected.

Proof. ■

Problem 1.1.23. Let X be a topological space. Let $A \subset X$ be connected. Prove \overline{A} is connected.

Proof. ■

Problem 1.1.24. Let X_1, X_2, \dots be topological spaces. Suppose $\prod_{n=1}^{\infty} X_n$ is locally connected. Prove that at most finitely many X_n are connected.

Proof. ■

Problem 1.1.25. Let X be a connected space and let $f: X \rightarrow Y$ be a function which is continuous and onto. Prove that Y is connected. (This is a theorem in Munkres—prove it from the definitions).

Proof. ■

Problem 1.1.26. Give:

- (i) $p: X \rightarrow Y$ is a quotient map.
- (ii) Y is connected.
- (iii) For every $y \in Y$, the set $p^{-1}(y)$ is connected.

Prove that X is connected.

Proof. ■

Problem 1.1.27. Let A be a subset of \mathbf{R}^2 which is homeomorphic to the open unit interval $(0, 1)$. Prove that A does not contain a nonempty set which is open in \mathbf{R}^2 .

Proof. ■

Problem 1.1.28. Let X be a connected space. Let \mathcal{U} be an open covering of X and let U be a nonempty set in \mathcal{U} . Say that a set V in \mathcal{U} is *reachable from* U if there is a sequence $U = U_1, U_2, \dots, U_n = V$ of sets in \mathcal{U} such that $U_i \cap U_{i+1} \neq \emptyset$ for each i from 1 to $n-1$. Prove that every nonempty V in \mathcal{U} is reachable from U .

Proof. ■

Problem 1.1.29. Suppose that X is connected and every point of X has a path-connected open neighborhood. Prove that X is path-connected.

Proof. ■

Problem 1.1.30. Let X be a topological space and let $f, g: X \rightarrow [0, 1]$ be continuous functions. Suppose that X is connected and f is onto. Prove that there must be a point $x \in X$ with $f(x) = g(x)$.
