o.1 Danielli: Winter 2012

Problem 1. Let $f(x, y)$, $0 \leq x, y \leq 1$, satisfy the following conditions: for each x , $f(x, y)$ is an integrable function of y , and $\partial f(x, y)/\partial x$ is a bounded function of (x, y) . Prove that $\partial f(x, y)/\partial x$ is a measurable function of y for each x and

$$\frac{d}{dx} \int_0^1 f(x, y) dy = \int_0^1 \frac{\partial f(x, y)}{\partial x} dy.$$

Solution. ►

◀

Problem 2. Let f be a function of bounded variation on $[a, b]$, $-\infty < a < b < \infty$. If $f = g + h$, with g absolutely continuous and h singular, show that

$$\int_a^b \varphi df = \int_a^b \varphi f' dx + \int_a^b \varphi dh.$$

Hint: A function h is said to be singular if $h' = 0$.

Solution. ►

◀

Problem 3. Let $E \subset \mathbb{R}$ be a measurable set, and let K be a measurable function on $E \times E$. Assume that there exists a positive constant C such that

$$\int_E K(x, y) dx \leq C \tag{1}$$

for a.e. $y \in E$, and

$$\int_E K(x, y) dy \leq C \tag{2}$$

for a.e. $x \in E$.

Let $1 < p < \infty$, $f \in L^p(E)$, and define

$$T_f(x) = \int_E K(x, y) f(y) dy.$$

(a) Prove that $T_f \in L^p(E)$ and

$$\|T_f\|_p \leq C \|f\|_p. \tag{3}$$

(b) Is (3) still valid if $p = 1$ or ∞ ? If so, are assumptions (1) and (2) needed?

Solution. ►

◄

Problem 4. Let f be a nonnegative measurable function on $[0, 1]$ satisfying

$$|\{x \in [0, 1] : f(x) > \alpha\}| < \frac{1}{1 + \alpha^2} \quad (4)$$

for $\alpha > 0$.

- (a) Determine values of $p \in [1, \infty)$ for which $f \in L^p[0, 1]$.
- (b) If p_0 is the minimum value of p for which p may fail to be in L^p , give an example of a function which satisfies (4), but which is not in $L^{p_0}[0, 1]$.

Solution. ►

◄

o.2 Danielli: Summer 2011

Problem 1. Let $f \in L^1(\mathbb{R})$, and let $F(t) = \int_{\mathbb{R}} f(x) \cos(tx) dx$.

- (a) Prove that $F(t)$ is continuous for $t \in \mathbb{R}$.
- (b) Prove the following *Riemman–Lebesgue lemma*:

$$\lim_{t \rightarrow \infty} F(t) = 0.$$

Hint: Start by proving the statement for $f = \chi_{[a,b]}$.

Solution. ►

◀

Problem 2. (a) Suppose that $f_k, f \in L^2(E)$, with E a measurable set, and that

$$\int_E f_k g \longrightarrow \int_E f g \quad (1)$$

as $k \rightarrow \infty$ for all $g \in L^2(E)$. If, in addition, $\|f_k\|_2 \rightarrow \|f\|_2$ show that f_k converges to f in L^2 , i.e., that

$$\int_E |f - f_k|^2 \longrightarrow 0$$

as $k \rightarrow \infty$.

- (b) Provide an example of a sequence f_k in L^2 and a function f in L^2 satisfying (1), but such that f_k does *not* converge to f in L^2 .

Solution. ►

◀

Problem 3. A bounded function f is said to be of bounded variation on \mathbb{R} if it is of bounded variation on any finite subinterval $[a, b]$, and moreover $A = \sup_{a,b} V[a, b; f] < \infty$. Here, $V[a, b; f]$ denotes the total variation of f over the interval $[a, b]$. Show that:

- (a) $\int_{\mathbb{R}} |f(x+h) - f(x)| dx \leq A|h|$ for all $h \in \mathbb{R}$.

Hint: For $h > 0$, write

$$\int_{\mathbb{R}} |f(x+h) - f(x)| dx = \sum_{n=-\infty}^{\infty} \int_{nh}^{(n+1)h} |f(x+h) - f(x)| dx.$$

- (b) $\left| \int_{\mathbb{R}} f(x) \varphi'(x) dx \right| \leq A$, where φ is any function of class C^1 , of bounded variation, compactly supported, with $\sup_{x \in \mathbb{R}} |\varphi(x)| \leq 1$.

Solution. ►

◀

Problem 4. (a) Prove the *generalized Hölder's inequality*: Assume $1 \leq p \leq \infty$, $j = 1, \dots, n$, with $\sum_{j=1}^{\infty} 1/p_j = 1/r \leq 1$. If E is a measurable set and $f_j \in L^{p_j}(E)$ for $j = 1, \dots, n$, then $\prod_{j=1}^n f_j \in L^r(E)$ and

$$\|f_1 \cdots f_n\|_r \leq \|f_1\|_{p_1} \cdots \|f_n\|_{p_n}.$$

- (b) Use part (a) to show that that if $1 \leq p, q, r \leq \infty$, with $1/p + 1/q = 1/r + 1$, $f \in L^p(\mathbb{R})$, and $g \in L^q(\mathbb{R})$, then

$$|(f * g)(x)| \leq \|f\|_p^{r-p} \|g\|_q^{r-q} \int |f(y)|^p |g(x-y)|^q dy.$$

(Recall that $(f * g)(x) = \int f(y)g(x-y) dy$.)

- (c) Prove *Young's convolution theorem*: Assume that p, q, r, f , and g are as in part (b). Then $f * g \in L^r(\mathbb{R})$ and

$$\|f * g\|_r \leq \|f\|_p \|g\|_q.$$

Solution. ►

◀

1 Bañuelos

1.1 Bañuelos: Summer 2000

Problem 1. Let (X, \mathcal{F}, μ) be a measure space and suppose $\{f_n\}$ is a sequence of measurable functions with the property that for all $n \geq 1$

$$\mu(\{x \in X : |f_n(x)| \geq \lambda\}) \leq C \exp(-\lambda^2/n)$$

for all $\lambda > 0$. (Here C is a constant independent of n .) Let $n_k = 2^k$. Prove that

$$\limsup_{k \rightarrow \infty} \frac{|f_{n_k}|}{\sqrt{n_k \log(\log(n_k))}} \leq 1 \quad \text{a.e.}$$

Solution. ▶ Suppose $\{f_n\}_{n=1}^\infty$ is a sequence of measurable functions such that

$$\mu(\{x \in X : |f_n(x)| \geq \lambda\}) \leq C \exp(-\lambda^2/n) \quad (1)$$

for all λ . Now, consider the subsequence $\{f_{2^k}\}_{k=1}^\infty$ of $\{f_n\}_{n=1}^\infty$. We aim to show that

$$\limsup_{k \rightarrow \infty} \frac{|f_{2^k}|}{\sqrt{2^k \log(\log(2^k))}} \leq 1$$

almost everywhere. To that end, it suffices to show that the set

$$E = \left\{ x \in X : \limsup_{k \rightarrow \infty} \frac{|f_{2^k}|}{\sqrt{2^k \log(\log(2^k))}} > 1 \right\}$$

has measure zero. Let $x \in E$ then

$$\limsup_{k \rightarrow \infty} \frac{|f_{2^k}(x)|}{\sqrt{2^k \log(\log(2^k))}} > 1.$$

This means that there exists some subsequence $\{k_m\}_{m=1}^\infty \subset \{k\}_{k=1}^\infty$ such that

$$\lim_{m \rightarrow \infty} \frac{|f_{2^{k_m}}(x)|}{\sqrt{2^{k_m} \log(\log(2^{k_m}))}} > 1.$$

This means that, for sufficiently large N

$$|f_{2^{k_n}}(x)| > \sqrt{2^{k_n} \log(\log(2^{k_n}))}$$

for all $n \geq N$. But by Equation (1) we have

$$\begin{aligned}
\mu\left(\left\{x \in X : \frac{|f_{2^{k_n}}(x)|}{\sqrt{2^{k_n} \log(\log(2^{k_n}))}} \geq 1\right\}\right) &\leq C \exp\left(-\left(\sqrt{2^{k_n} \log(\log(2^{k_n}))}\right)^2 / 2^{k_n}\right) \\
&= C \exp\left(-2^{k_n} \log(\log(2^{k_n})) / 2^{k_n}\right) \\
&= C \exp\left(-\log(\log(2^{k_n}))\right) \\
&= C \exp\left(\log(1/\log(2^{k_n}))\right) \\
&= \frac{C}{\log(2^{k_n})}.
\end{aligned} \tag{2}$$

Letting $n \rightarrow \infty$, we see that the measure of the set on the left-hand side of Equation (2) must go to 0 so $\mu(E) = 0$. \blacktriangleleft

Problem 2. Let (X, \mathcal{F}, μ) be a finite measure space. Let f_n be a sequence of measurable functions with $f_1 \in L^1(\mu)$ and with the property that

$$\mu(\{x \in X : |f_n(x)| > \lambda\}) \leq \mu(\{x \in X : |f_1(x)| > \lambda\})$$

for all n and all $\lambda > 0$. Prove that

$$\lim_{n \rightarrow \infty} \frac{1}{n} \int_X \left[\max_{1 \leq j \leq n} |f_j| \right] d\mu = 0.$$

[Hint: You may use the fact that $\|f\|_1 = \int_0^\infty \mu(\{|f(x)| > \lambda\}) d\lambda$.]

Solution. \blacktriangleright Define $g_n, h_n: \mathcal{F} \rightarrow [0, \infty]$ for $n \in \mathbb{N}$ by

$$g_n(\lambda) = \mu(\{x \in X : |f_n(x)| > \lambda\}), \quad h_n(\lambda) = \mu\left(\left\{x \in X : \max_{1 \leq i \leq n} |f_i(x)| > \lambda\right\}\right).$$

Now, note that, by the monotonicity of μ , we have

$$h_n(\lambda) \leq \sum_{i=1}^n g_n(\lambda) \leq n g_1(\lambda).$$

Thus,

$$\frac{h_n(\lambda)}{n} \leq g_1(\lambda).$$

Since $\|f_1\|_1 = \int_0^\infty g_1(\lambda) d\lambda$, by Lebesgue's dominated convergence theorem, we have

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{1}{n} \int_X \left[\max_{1 \leq j \leq n} |f_j| \right] d\mu &= \lim_{n \rightarrow \infty} \int_X \frac{h_n(x)}{n} d\mu \\ &= \int_X \lim_{n \rightarrow \infty} \frac{h_n(x)}{n} d\mu \\ &\leq \int_X \lim_{n \rightarrow \infty} \frac{\mu(X)}{n} \\ &= 0 \end{aligned}$$

as we wanted to show. ◀

Problem 3.

- (i) Let (X, \mathcal{F}, μ) be a finite measure space. Let $\{f_n\}$ be a sequence of measurable functions. Prove that $f_n \rightarrow f$ is measurable if and only if every subsequence $\{f_{n_k}\}$ contains a further subsequence $\{f_{n_{k_j}}\}$ that converges a.e. to f .
- (ii) Let (X, \mathcal{F}, μ) be a finite measure space. Let $F: \mathbb{R} \rightarrow \mathbb{R}$ be continuous and $f_n \rightarrow f$ in measure. Prove that $F(f_n) \rightarrow F(f)$ in measure. (You may assume, of course, that $f_n, F, F(f_n)$, and $F(f)$ are all measurable.)

Solution. ▶ Recall that a sequence of measurable functions $\{f_n\}$ converge in measure to a limit f if for every $\varepsilon > 0$ the limit

$$\lim_{n \rightarrow \infty} \mu(\{x \in X : |f(x) - f_n(x)| \geq \varepsilon\}) = 0.$$

For part (i) \implies suppose that $f_n \rightarrow f$ in measure. Then given $\varepsilon > 0$ and $\delta > 0$ there exists $N \in \mathbb{N}$ such that $n \geq N$ implies

$$\mu(\{x \in X : |f(x) - f_n(x)| \geq \varepsilon\}) < \delta.$$

In particular, given $\varepsilon = k^{-1}$ and $\delta = 2^{-k}$, consider the countable collection of measurable sets $\{E_k\}_{k=1}^\infty$ given by

$$E_k = \left\{ x \in X : |f(x) - f_{n_k}(x)| \geq \frac{1}{k} \right\},$$

where $n_k \geq N(k)$ (which depends on our choice of k) such that

$$\mu(E_k) < \frac{1}{2^k}.$$

Now, by the Borel–Cantelli lemma, since

$$\sum_{k=1}^{\infty} \mu(E_k) < \sum_{k=1}^{\infty} 2^{-k} = 1 < \infty,$$

for almost every $x \in X$, there exists $N_x \in \mathbb{N}$ such that $x \notin E_k$ for $k \geq N_x$. This means that for $k \geq N_x$, we have

$$|f(x) - f_{n_k}(x)| < \frac{1}{k}.$$

Let $\{f_{n_{k+1}}\}$ be the subsequence of $\{f_{n_k}\}$. Then

$$\lim_{k \rightarrow \infty} f_{n_{k+1}} = f$$

as desired.

\Leftarrow On the other hand, suppose that every subsequence $\{f_{n_k}\}$ of $\{f_n\}$ contains a subsequence $\{f_{n_{k_j}}\}$ that converges to f . Seeking a contradiction, suppose that given $\varepsilon > 0$ there exists a subsequence $\{f_{n_k}\}$ of $\{f_n\}$ such that

$$M = \mu(\{x \in X : |f(x) - f_{n_k}(x)| \geq \varepsilon\}) > 0.$$

But by assumption there exists a subsequence $\{f_{n_{k_j}}\}$ of $\{f_{n_k}\}$ that converges almost everywhere to f . We claim that this implies that $f_{n_{k_j}} \rightarrow f$ in measure.

Proof of claim. This is adapted from a proof in Royden, Proposition 3, Ch. 5.

First note that f is measurable since it is the pointwise limit almost everywhere of a sequence of measurable functions. Let $\varepsilon, \delta > 0$ be given. **Here is where the assumption that $\mu(X) < \infty$ is essential!** By Egorov's theorem, there is a measurable subset $E \subset X$ with $\mu(X \setminus E) < \delta$ such that $f_n \rightarrow f$ uniformly on E . Thus, there is an index N such that $n \geq N$ implies

$$|f_n(x) - f(x)| < \varepsilon$$

for all $x \in E$. Thus, for $n \geq N$,

$$\{x \in X : |f(x) - f_n(x)| \geq \varepsilon\} \subset X \setminus E$$

so

$$\mu(\{x \in X : |f(x) - f_n(x)| \geq \varepsilon\}) < \varepsilon.$$

Thus, we have

$$\lim_{n \rightarrow \infty} \mu(\{x \in X : |f(x) - f_n(x)| \geq \varepsilon\}) = 0,$$

i.e., $f_n \rightarrow f$ in measure. ■

Hence, since $f_{n_{k_j}} \rightarrow f$ in measure, but $M > 0$ we have a contradiction.

For (ii) since F is continuous given $\varepsilon > 0$ there exist $\delta > 0$ such that $|x - x'| < \delta$ implies $|F(x) - F(x')| < \varepsilon$. By part (i), $f_n \rightarrow f$ in measure if and only if every subsequence $\{f_{n_k}\}$ of $\{f_n\}$ contains a subsequence $\{f_{n_{k_j}}\}$ that converges to f almost everywhere, i.e., given $\delta > 0$ there exists an index N such that $n_{k_j} \geq N$ implies

$$|f(x) - f_{n_{k_j}}(x)| < \delta$$

for almost every $x \in X$. Thus,

$$|F(f(x)) - F(f_{n_{k_j}}(x))| < \varepsilon$$

and we see that for every subsequence $\{F \circ f_{n_k}\}$ of $\{F \circ f_n\}$ we can find a subsequence $\{F \circ f_{n_{k_j}}\}$ that converges almost everywhere to $F \circ f$. \blacktriangleleft

Problem 4. Let (X, \mathcal{F}, μ) be a finite measure space and suppose $f \in L^1(\mu)$ is nonnegative. Suppose $1 < p < \infty$ and let $1 < q < \infty$ be its conjugate exponent, i.e., $1/p + 1/q = 1$. Suppose f has the property that

$$\int_E f \, d\mu \leq \mu(E)^{1/q}$$

for all measurable sets E . Prove that $f \in L^r(\mu)$ for any $1 \leq r < p$.

[Hint: Consider $\{x \in X : 2^n \leq f(x) < 2^{n+1}\}$, if you like.]

Solution. \blacktriangleright By previous problems, we know that if $\mu(X) < \infty$ and $f \in L^p(X)$, then $f \in L^r(X)$ for $1 \leq r < p$, so it suffices to show that $\|f\|_p < \infty$.

Instead of following the hint, consider the set

$$E_t = \{x \in X : f(x) \geq t\}$$

and let

$$\omega(t) = \mu(E_t),$$

i.e., the distribution function of f . Then, we have

$$\int_0^\infty \omega(t) \, dt = \int_X f \, d\mu.$$

In particular, if we make the substitution $\alpha = t^{1/p}$, $d\alpha = t^{1/q}/p \, dt = \alpha^{p/q}/p \, dt$, we have

$$\int_X f^r \, d\mu = \int_0^\infty p\alpha^{-p/q} \omega(\alpha) \, d\alpha.$$

Now, by Chebyshev's inequality, we have

$$t\omega(t) \leq \int_{E_t} f \, d\mu \leq \omega(t)^{1/q}$$

so

$$\omega(t) \leq t^{-p}.$$

Thus,

$$\int_X f^r \, d\mu = \int_0^\infty p\alpha^{-p/q} \omega(\alpha) \, d\alpha \leq \int_0^\infty p\alpha^{-p-p/q} \, d\alpha.$$

Since $p + p/q > 1$, the integral above is finite. Thus, $f \in L^p(X)$ and we have $f \in L^r(X)$ for all $1 \leq r < p$. ◀

Problem 5. Let f be a continuous function on $[-1, 1]$. Find

$$\lim_{n \rightarrow \infty} \int_{-1/n}^{1/n} f(x)(1 - n|x|) \, dx.$$

Solution. ▶ To find the limit of the integral

$$\int_{-1/n}^{1/n} f(x)(1 - n|x|) \, dx$$

we first make the following substitutions: Let $y = nx$, $dy = n \, dx$. Then

$$\int_{-1/n}^{1/n} f(x)(1 - n|x|) \, dx = \frac{1}{n} \int_{-1}^1 f(y/n)(1 - |y|) \, dy.$$

By the extreme value theorem, since f is continuous and $[-1, 1]$ is compact f is bounded on $[-1, 1]$ by, say M . Let $g(x) = M$. Then $g \in L^1(X)$ since $\|g\|_1 = 2M$. Thus, by the Lebesgue dominated convergence theorem, since

$$|f(y/n)(1 - |y|)| \leq M$$

on $[-1, 1]$ and $g \in L^1([-1, 1])$ it follows that

$$\begin{aligned} \lim_{n \rightarrow \infty} \int_{-1/n}^{1/n} f(x)(1 - n|x|) \, dx &= \lim_{n \rightarrow \infty} \frac{1}{n} \int_{-1}^1 f(y/n)(1 - |y|) \, dy \\ &= \int_{-1}^1 \lim_{n \rightarrow \infty} \left[\frac{f(y/n)(1 - |y|)}{n} \right] dy \\ &= \int_{-1}^1 \lim_{n \rightarrow \infty} \left[\frac{f(y/n)}{n} - \frac{|y|}{n} \right] dy \\ &= 0. \end{aligned}$$

◀

Problem 6. Let (X, \mathcal{F}, μ) be a measure space and suppose $f \in L^p(\mu)$, $1 \leq p < \infty$. Suppose E_n is a sequence of measurable sets satisfying $\mu(E_n) = 1/n$ for all n . Prove that

$$\lim_{n \rightarrow \infty} \left[n^{(p-1)/p} \int_{E_n} |f| d\mu \right] = 0.$$

Solution. ► The result follows immediately by Hölder's inequality. Let $C = \|f\|_p$. Since $f \in L^p(X)$, then $f \in L^p(E_n)$ for all $n \in \mathbb{N}$. Thus, by Hölder's inequality

$$\begin{aligned} \|f\|_{L^1(E_n)} &\leq \|f\|_{L^p(E_n)} \mu(E_n)^{1/q} \\ &\leq C \mu(E_n)^{1/q} \\ &= C \mu(E)^{p/(p-1)} \\ &= C n^{-p/(p-1)} \\ &= C n^{p/(1-p)}. \end{aligned}$$

Hence, the integral is bounded above by

$$\begin{aligned} 0 \leq n^{(p-1)/p} \int_{E_n} |f| d\mu &\leq C n^{(p-1)/p + p/(1-p)} \\ &= C n^{(2p-1)/(p(1-p))}. \end{aligned}$$

Since $p > 1$, $1 - p < 0$ and $2p - 1 > 0$ so the exponent $(2p - 1)/(p(1 - p)) < 0$. Thus, as $n \rightarrow \infty$

$$C n^{(2p-1)/(p(1-p))} \longrightarrow 0.$$

It follows that

$$\lim_{n \rightarrow \infty} \left[n^{(p-1)/p} \int_{E_n} |f| d\mu \right] = 0. \quad \blacktriangleleft$$

Problem 7. Let (X, \mathcal{M}, μ) be a measure space and let $\{g_n\}$ be a sequence of non-negative measurable functions with the property that $g_n \in L^1(\mu)$ for every n and $g_n \rightarrow g$ in $L^1(\mu)$. Let $\{f_n\}$ be another sequence of nonnegative measurable functions on (X, \mathcal{F}, μ) .

(i) If $f_n \leq g_n$ almost everywhere for every n , prove that

$$\limsup_{n \rightarrow \infty} \int_X f_n d\mu \leq \int_X \limsup_{n \rightarrow \infty} f_n d\mu.$$

[Hint: Start by considering a subsequence $\{f_{n_k}\}$ such that

$$\lim_{n_k \rightarrow \infty} \int_X f_{n_k} d\mu = \limsup_{n \rightarrow \infty} \int_X f_n d\mu$$

and let $\{g_{n_{k_j}}\}$ be a subsequence of $\{g_{n_k}\}$ such that $g_{n_{k_j}} \rightarrow g$ almost everywhere.]

- (ii) If $f_n \rightarrow f$ almost everywhere and if $f_n \leq g_n$ almost everywhere for all n , then $\|f_n - f\|_1 \rightarrow 0$ as $n \rightarrow \infty$.

Solution. ▶ Part (i) is a generalization of what is colloquially known as the reverse Fatou's lemma. Consider the sequence of measurable functions $\{h_n\}$ where $h_n = g_n - f_n$. Note that $h_n \geq 0$ for all $x \in X$ since $g_n \geq f$ for all $x \in X$. ◀

Problem 8. Let $f \in L^1(\mathbb{R})$. Consider the function

$$F(x) = \int_{\mathbb{R}} \exp(ixt) f(t) dt. \quad \oint \iint$$

- (i) Show that $F \in L^\infty(\mathbb{R})$ and that F is continuous at every $x \in \mathbb{R}$. Moreover, if $|t|^k f(t) \in L^\infty(\mathbb{R})$ for all $k \geq 1$, show that F is infinitely differentiable, i.e., $F \in C^\infty(\mathbb{R})$.
- (ii) Suppose f is continuous as well as in $L^1(\mathbb{R})$. Show that $\lim_{|x| \rightarrow \infty} F(x) = 0$.

[Hint: Using $\exp(-i\pi) = -1$, write $F(x) = (\int_{\mathbb{R}} (\exp(ixt) - \exp(ixt - i\pi))) / 2$.]

Solution. ▶ ◀

1.2 Bañuelos: Summer 2000

Problem 1. For any two subsets A and B of \mathbb{R} define $A + B = \{a + b : a \in A, b \in B\}$.

- (i) Suppose A is closed and B is compact. Prove that $A + B$ is closed.
- (ii) Give an example that shows that (i) may be false if we only assume that A and B are closed.

Solution. ▶

Problem 2. Suppose $f: [0, 1] \rightarrow \mathbb{R}$ is differentiable at every $x \in [0, 1]$ where by differentiability at 0 and 1 we mean right and left differentiability, respectively. Prove that f' is continuous if and only if f is uniformly differentiable. That is, if and only if for all $\varepsilon > 0$ there is an $h_0 > 0$ such that

$$\left| \frac{f(x+h) - f(x)}{h} - f'(x) \right| < \varepsilon$$

whenever $0 \leq x, x+h \leq 1, 0 < |h| < h_0$.

Solution. ▶

Problem 3. Let (X, \mathcal{F}, μ) be a measure space with $\mu(X) = 1$ and let F_1, \dots, F_{17} be seventeen measurable subsets of X with $\mu(F_j) = 1/4$ for every j .

- (i) Prove that five of these subsets must have an intersection of positive measure. That is, if E_1, \dots, E_k denotes the collection of all nonempty intersections of the F_j taken five at a time ($k \leq 6188$), show that at least one of these sets must have positive measure.
- (ii) Is the conclusion in (i) true if we take sixteen sets instead of seventeen?

Solution. ▶

Problem 4. Let $f_n: X \rightarrow [0, \infty)$ be a sequence of measurable functions on the measure space (X, \mathcal{F}, μ) . Suppose there is a positive constant M such that the functions $g_n(x) = f(x)\chi_{\{f_n \leq M\}}(x)$ satisfy $\|g_n\|_1 \leq A/n^{4/3}$ and for which $\mu(\{x \in X : f_n(x) > M\}) \leq B/n^{5/4}$, where A and B are positive constants independent of n . Prove that

$$\sum_{n=1}^{\infty} f_n < \infty$$

almost everywhere.

Solution. ►

◀

Problem 5. Let $\{g_n\}$ be a bounded sequence of functions on $[0, 1]$ which is uniformly Lipschitz. That is there is a constant M (independent of n) such that for all n , $|g_n(x) - g_n(y)| \leq M|x - y|$ for all $x, y \in [0, 1]$ and $|g_n(x)| \leq M$ for all $x \in [0, 1]$.

(i) Prove that for any $0 \leq a \leq b \leq 1$,

$$\lim_{n \rightarrow \infty} \int_a^b g_n(x) \sin(2n\pi x) dx = 0.$$

(ii) Prove that for any $f \in L^1[0, 1]$,

$$\lim_{n \rightarrow \infty} \int_0^1 f(x) g_n(x) \sin(2n\pi x) dx = 0.$$

Solution. ►

◀

Problem 6. Let $\{f_n\}$ be a sequence of nonnegative functions in $L^1[0, 1]$ with the property that $\int_0^1 f_n(t) dt = 1$ and $\int_{1/n}^1 f_n(t) dt \leq 1/n$ for all n . Define $h(x) = \sup_n f_n(x)$. Prove that $h \notin L^1[0, 1]$.

Solution. ►

◀

1.3 Bañuelos: Winter 2007

Problem 1. Let $f: [0, 1] \rightarrow \mathbb{R}$.

- (i) Define what it means for f to be absolutely continuous.
- (ii) Define what it means for f to be of bounded variation.
- (iii) Let $V(f; 0, x)$ be the total variation of f on $[0, x]$. Prove that if f is absolutely continuous on $[0, 1]$ so is $V(f; 0, x)$.

Solution. ►

◀

Problem 2.

- (i) Suppose that $f: [0, 1] \rightarrow \mathbb{R}$ is nondecreasing with $f(0) = 0$ and $f(1) = 1$. For $a > 0$, let A be set of all $x \in (0, 1)$ for which

$$\limsup_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} > a.$$

Prove that $m^*(A) < 1/a$, where m^* denotes the Lebesgue outer measure.

- (ii) Prove that there is no Lebesgue measurable set A in $[0, 1]$ with the property that $m(A \cap I) = m(I)/4$ for every interval I .

[Hint: Consider the function $f(x) = \chi_A(x)$.]

Solution. ►

◀

Problem 3. Let $\{E_j\}_{j=1}^\infty$ be Lebesgue measurable sets in $[0, 1]$ and let $E = \bigcup_{j=1}^\infty E_j$ and suppose there is an $\varepsilon > 0$ such that $\sum_{j=1}^\infty m(E_j) \leq m(E) + \varepsilon$.

- (i) Show that for all measurable sets $A \subset [0, 1]$

$$\sum_{j=1}^\infty m(A \cap E_j) \leq m(A \cap E) + \varepsilon.$$

- (ii) Let A be the set of all $x \in [0, 1]$ which are in at least two of E_j . Prove that $m(A) \leq \varepsilon$.

Solution. ►

◀

Problem 4. Let (X, \mathcal{F}, μ) be a finite measure space. Let $f_n: X \rightarrow [0, \infty)$ be a sequence measurable functions and suppose that $\|f_n\|_p \leq 1$, $1 < p < \infty$, and that $f_n \rightarrow f$ almost everywhere. Prove

- (i) $f \in L^p(\mu)$.
- (ii) $\|f_n - f\|_1 \rightarrow 0$ as $n \rightarrow \infty$.

1.4 Bañuelos: Winter 2013

Problem 1.

(a)

- (i) Define almost uniform convergence on the measure space (X, \mathcal{F}, μ) .
- (ii) Let f_n be a sequence of nonnegative measurable functions converging almost uniformly to the nonnegative function f . Prove that $\sqrt{f_n}$ converges almost uniformly to \sqrt{f} .

(b)

- (i) Suppose f_n has the property that $\int_X |f_n| d\mu \rightarrow 0$.
- (ii) Does it follow that $f_n \rightarrow 0$ almost everywhere? Justify your answer.
- (iii) Does it follow that $f_n \rightarrow 0$ almost uniformly? Justify your answer.

Solution. ►

◄

Problem 2. Let (X, \mathcal{F}, μ) be a measure space and let $1 \leq p \leq \infty$ and q be its conjugate exponent. Suppose $f_n \rightarrow f$ in L^p and $g_n \rightarrow g$ in L^q . Prove that $f_n g_n \rightarrow f g$ in L^1 .

Solution. ►

◄

Problem 3. Let $\{a_k\}$ be a sequence of positive numbers converging to infinity. Prove that the following limit exists

$$\lim_{k \rightarrow \infty} \int_0^\infty \frac{\exp(-x) \cos x}{a_k x^2 + (1/a_k)} dx$$

and find it. Make sure to justify all steps.

Solution. ►

◄

Problem 4. Let (X, \mathcal{F}, μ) be σ -finite and f be measurable such that for all $\lambda > 0$

$$\mu(\{x \in X : |f(x)| > \lambda\}) \leq \frac{20}{\lambda^p}$$

where $1 < p < \infty$. Let q be the conjugate exponent of p . Prove that there is a constant C depending only on p such that

$$\int_E |f(x)| d\mu \leq C m(E)^{1/q},$$

for all measurable sets E with $0 < \mu(E) < \infty$. (The inequality holds trivially when $\mu(E) = 0$ or $\mu(E) = \infty$.)

[Hint: Recall $\int_E |f(x)| d\mu = \int_0^\infty \lambda d\lambda$ and “break it” at the right place!]

Solution. ▶

◀

Problem 5. Suppose $f: [0, 1] \rightarrow \mathbb{R}$ is of bounded variation with $V(f; 0, 1) = \alpha$. For any $\beta > \alpha$, set

$$A = \left\{ x \in (0, 1) : \limsup_{h \rightarrow 0} \frac{|f(x+h) - f(x)|}{|h|} > \beta \right\}.$$

Prove that for any $0 < p < 1$, $m(A) \leq (\alpha/\beta)^p$, where m denotes the Lebesgue measure.

Solution. ▶

◀

Problem 6. Let $f \in L^1(0, 1)$ and for $x \in (0, 1)$, define

$$h(x) = \int_x^1 \frac{f(t)}{t} dt.$$

- (i) Prove that h is continuous on $(0, 1)$.
- (ii) Show that

$$\int_0^1 h(t) dt = \int_0^1 f(t) dt.$$
