Problem 1.1. Let (G, \cdot) be a group. Show that G is Abelian whenever $\text{Aut}(G)$ is a cyclic group under composition.

Proof. Suppose that $\text{Aut}(G)$ is cyclic. Then $\text{Inn}(G) < \text{Aut}(G)$ is cyclic. But $\text{Inn}(G) \cong G/Z(G)$. Thus, G is Abelian by the following lemma.

Lemma 1. Let (G, \cdot) be a group. If $G/Z(G)$ is cyclic, then G is Abelian.

Proof of lemma. Suppose that $G/Z(G)$ is cyclic. Then $G/Z(G) = \langle \bar{x} \rangle$ for some representative $x \in G$. This means that for any $g \in G$, we can write $g = x^k z$ for some positive integer k , for some $z \in Z(G)$. Let $g_1, g_2 \in G$. Then, by the following obvious algebraic manipulations

$$g_1 g_2 = x^{k_1} z_1 x^{k_2} z_2 = z_1 x^{k_1+k_2} z_2 = z_2 x^{k_2+k_1} z_1 = z_2 x^{k_2} x^{k_1} z_1 = (x^{k_2} z_2)(x^{k_1} z_1) = g_2 g_1,$$

we see that G is Abelian. ♣

Problem 1.2. Let (G, \cdot) be an Abelian group. The *torsion subgroup* of G is defined as the collection of elements of finite order:

$$\text{Tor}(G) := \{ g \in G \mid g^m = e \text{ for some integer } m > 0 \}.$$

- (a) Show that the quotient group $G/\text{Tor}(G)$ is *torsion free*, i.e., it contains no nontrivial elements of finite order.
- (b) Show that $\text{Tor}(G)$ is finite whenever G is finitely generated. (Do not assume that G is finite.)

Proof. (a) (Presumably the torsion subgroup is a normal subgroup of G .) Define $T := \text{Tor}(G/\text{Tor}(G))$. We will show that $T = \bar{e}$. It is clear that $\langle \bar{e} \rangle \subset T$ thus, we need only show that $T \subset \langle \bar{e} \rangle$, i.e., if $t \in T$ then $g = \bar{e}$. Let $\bar{g} \in T$. Then $\bar{g} \in G/\text{Tor}(G)$ and $\bar{g}^m = \bar{e}$ for some positive integer m . But $\bar{g}^m = \bar{e}$ implies that $g^m \text{Tor}(G) = \text{Tor}(G)$, i.e., $g^m \in \text{Tor}(G)$. Thus, $(g^m)^n = g^{mn} e$ for some positive integer n . Thus, $g \in \text{Tor}(G)$ so we must have $\bar{g} = \bar{e}$.

(b) Suppose that G is finitely generated. By the fundamental theorem of finitely generated Abelian groups, $G \cong \mathbb{Z}^r \times Z_{s_1} \times \cdots \times Z_{s_n}$ for positive integers r, s_1, \dots, s_n . It suffices to show that $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n} = \text{Tor}(G)$ (once we have demonstrated this, note that $|\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}| = s_1 \cdots s_n < \infty$). It is clear that $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n} \subset \text{Tor}(G)$ since every element of $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}$ has finite order, i.e., for any $(\mathbf{1}, z_1, \dots, z_n) \in \mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}$, we have $z = (\mathbf{1}, z_1, \dots, z_n)^{s_1 \cdots s_n} = (\mathbf{1}, 1, \dots, 1)$ (as a consequence of Lagrange's theorem). Now, suppose $z := (\mathbf{z}, z_1, \dots, z_n) \in \text{Tor}(G)$. Then $z^m = (\mathbf{1}, 1, \dots, 1)$ for some positive integer m . Since every non-identity element of \mathbb{Z}^r has infinite order, $\mathbf{z} = \mathbf{1}$ and $s_i \mid k$ for all i . Thus $z \in \mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}$. Thus, $|\text{Tor}(G)| = s_1 \cdots s_n$ so $\text{Tor}(G)$ is indeed finite. ■

Problem 1.3. Let (G, \cdot) be a group of order $|G| = 351$. Show that G is solvable.

Proof. The best plan of attack is to use Sylow's theorem. First, let us factor the order of G into powers of primes, $|G| = 351 = 3^3 \cdot 13$. In light of this factorization, it suffices to show that either $|\text{Syl}_{13}(G)| = 1$ or $|\text{Syl}_3(G)| = 1$ and hence, the unique Sylow-13 (or Sylow-3) subgroup will be a normal subgroup of G . By Sylow's theorem, $n_{13} \equiv 1 \pmod{13}$ and $n_{13} \mid 3^3$. Thus, $n_{13} = 1$ or 27 . Suppose $n_{13} = 27$. Then G contains $12 \times 27 = 324$ elements of order 13 so there are $351 - 324 - 1 = 26$ elements remaining. This implies that $n_3 = 1$. Thus, $P_3 \in \text{Syl}_3(G)$ is the unique Sylow-3 subgroup of G hence, is normal. Thus, $G \triangleright P_3$ so G/P_3 is a group. Incidentally, $G/P_3 \cong Z_{13}$ hence, solvable and P_3 is a p -group, hence solvable. Thus, G is solvable.

On the other hand, if $n_{13} = 1$ then $P_{13} \in \text{Syl}_{13}(G)$ is the unique Sylow-13 subgroup of G hence, normal in G . Since P_{13} is a p -group, it is solvable. Moreover, G/P_{13} is a group of order 3^3 , i.e., a p -group, hence, solvable. Thus, G is solvable.

In either case, we have shown that G must be solvable. ■

Problem 1.4. Let (G, \cdot) be a group, and $H < G$ a subgroup of finite index. Show that there exists a normal subgroup $N \triangleleft G$ contained in H which is also of finite index. (Do not assume that G is finite.)

Proof. Suppose $H < G$ is a subgroup of finite index, i.e., H partitions G into a finite number of cosets, say $G/H := \{H, g_1H, \dots, g_{k-1}H\}$. Define a homomorphism $\varphi: G \rightarrow S_{G/H}$ by $g \mapsto gH$ (this is clearly a homomorphism: take $g_1, g_2 \in G$ then $\varphi(g_1g_2) = g_1g_2H = (g_1H)(g_2H) = \varphi(g_1)\varphi(g_2)$). Thus, $\ker \varphi \triangleleft G$ of finite index (in particular, by the 1st isomorphism theorem and Lagrange's theorem $|G : \ker \varphi| \mid |S_{G/H}| = |S_k| = k!$). Thus, it suffices to show that $\ker \varphi < H$. But this is clear since, if $g \in \ker \varphi$ then $gH = H$ hence, $g \in H$. ■

Problem 1.5. Let (G, \cdot) be a finite group, and $\varphi: G \rightarrow G$ be a group homomorphism. Show that for all normal Sylow p -subgroups $P \triangleleft G$ we have $\varphi(P) < P$.

Proof. Suppose $|G| < \infty$ and let $P \in \text{Syl}_p(G)$ be normal in G . Then P is unique of order p^α for some α . By the 1st isomorphism theorem, $\varphi(P) \mid p^\alpha$ so $\varphi(P)$ must be contained in a Sylow p -subgroup of G . Since P is the unique Sylow p -subgroup of G , $\varphi(P) < P$. ■

Problem 1.6. Let $(R, +, \cdot)$ be a commutative ring with $1 \neq 0$.

- (a) Show that R is an integral domain if and only if (0) is a prime ideal.
- (b) Show that R is a field if and only if (0) is a maximal ideal.

Proof. (a) \Leftarrow Suppose that (0) is a prime ideal. Then $R/(0)$ is a domain. But $R/(0) \cong R$ (canonically i.e., the map $\bar{r} \mapsto r$ is a bijective homomorphism) hence, R is a domain.

\Leftarrow Conversely, suppose that R is a domain.

(b) ■

Problem 1.7. let $(R, +, \cdot)$ be a unique factorization domain. Choose an irreducible element $p \in R$, and define the *localization at p* as the ring of fractions $R_p = D^{-1}R$ with respect to the multiplicative set $D = R - (p)$. Show that R_p is a principal ideal domain.

Proof. ■

Problem 1.8. Let $(F, +, \cdot)$ be a field, and $F(\theta)/F$ be a finite, separable extension. Let L be the splitting field of the minimal polynomial $m_{\theta, F}(x) \in F[x]$. Prove that for every prime p dividing the degree $[L : F]$, there exists a field K such that $F \subset K \subset L$, $[L : K] = p$, and $L = K(\theta)$.

Proof. ■

Problem 1.9. Let $(\mathbb{F}_p, +, \cdot)$ be a finite field whose Cardinality p is prime. Fix a positive integer n which is not divisible by p , and let ζ_n be a primitive n th root of unity. Show that $[\mathbb{F}_p(\zeta_n) : \mathbb{F}_p] = \alpha$ is the least positive integer such that $p^\alpha \equiv 1 \pmod{n}$.

Proof. ■

Problem 1.10. Prove that the Galois group of the splitting field over \mathbb{Q} of $f(x) = x^4 + 4x^2 + 2$ is a cyclic group.

Proof. ■

2 Spring 2008

Problem 2.1. Let (G, \cdot) be a group, $(H, +)$ be an Abelian group, and $\varphi: G \rightarrow H$ be a group homomorphism. If N is a subgroup such that $\ker \varphi < N < G$, show that $N \triangleleft G$ is a normal subgroup.

Proof. Let N be a subgroup of G containing $\ker \varphi$. Then we must show that for any $g \in G$, $gNg^{-1} \subset N$. First we observe that, since $\ker \varphi \triangleleft G$, then $\ker \varphi \triangleleft N$ since for any $g \in N$, g is also in G so that $g(\ker \varphi)g^{-1} = \ker \varphi \subset N$. Thus, $\ker \varphi \triangleleft N$. By the first isomorphism theorem¹, $G/\ker \varphi \cong H$ hence, $G/\ker \varphi$ is Abelian. Moreover, $N/\ker \varphi < G/\ker \varphi$ hence, $N/\ker \varphi \triangleleft G/\ker \varphi$. It follows immediately from the lattice isomorphism theorem² (this is essentially the UMP of the quotient by a group) that $N \triangleleft G$. ■

Problem 2.2. Let (G, \cdot) be a finite Abelian group of even order, i.e., $|G| = 2k$ for some $k \in \mathbb{N}$.

- (a) For k odd, show that G has exactly one element of order 2.
- (b) Does the same happen for k even? Prove or give a counterexample.

Proof. (a) This problem is most easily proven using Cauchy's theorem³. Suppose that k is odd. If $k = 1$, $G \cong Z_2$ and we are done (Z_2 contains only one nontrivial element and its order is 2). Otherwise $k > 2$. Then by Cauchy's theorem we are guaranteed that there exists an element $g \in G$ of order 2. Suppose h is another element (distinct from g) of order 2. Since 2 is the smallest prime number dividing the order of G , by a corollary to Cayley's theorem⁴, $\langle g \rangle$ is a normal subgroup of G so $G/\langle g \rangle$ is a group. Moreover, since $h \neq g$, then $\bar{h} \neq \bar{e}$ and $2 \geq |\bar{h}| > 1$ implies that $|\bar{h}| = 2$. But $2 \nmid k = |G/\langle g \rangle|$ contradicting Lagrange's theorem. It follows that G must have exactly one element of order 2.

(b) No. Here is the simplest counterexample: Consider the direct product $Z_2 \times Z_2$. The elements $(1, 0)$ and $(0, 1)$ are elements of order 2, but are not equivalent. ■

Problem 2.3. Let (G, \cdot) be a finite group of odd order, and $H \triangleleft G$ be a normal subgroup of prime order $|H| = 17$. Show that $H < Z(G)$.

Proof. Let G act on H by conjugation, i.e., the map $\varphi: G \times H \rightarrow H$ defined by the rule $\varphi(g, h) := ghg^{-1}$ determines a group action on H . First, we verify that φ indeed defines a group action on H : First, observe that for $e_G \in G$ the identity element, $\varphi(e_G, h) = e_G h e_G^{-1} = h$; next, if $g_1, g_2 \in G$ then

$$\varphi(g_1, \varphi(g_2, h)) = \varphi(g_1, g_2 h g_2^{-1}) = g_1 g_2 h g_2^{-1} g_1^{-1} = g_1 g_2 h (g_1 g_2)^{-1} = \varphi(g_1 g_2, h).$$

Lastly, φ is clearly well-defined in the sense $\varphi(g, h) \in H$ for all $g \in G$, $h \in H$. Thus, φ is a group action. Now, let us ask what the kernel of this action is. Thus group action φ , induces a group homomorphism $\varphi': G \rightarrow \text{Aut}(H)$ given by $\varphi'(g) := \text{Eval}(\varphi, g)$. Now, since $|H| = 17$, $H \cong Z_{17}$, hence is cyclic. Thus, $\text{Aut}(H) \cong (\mathbb{Z}/17\mathbb{Z})^\times \cong Z_{16}$. Now, since $|\varphi'(G)| \mid |G|$, $|\varphi'(G)|$ is odd. But $\varphi'(G) < \text{Aut}(H)$ so, by Lagrange's theorem, $|\varphi'(G)| \mid 16$. Thus, $|\varphi'(G)| = 1$, i.e., φ' is the trivial homomorphism, i.e., $\varphi(g, h) = ghg^{-1} = h = \varphi(1, h)$. Thus, $H < Z(G)$. ■

¹Theorem 16 of Dummit and Foote §3, p. 99.

²Theorem 20 of Dummit and Foote §3, p. 99.

³Theorem 11 of Dummit and Foote §3, p. 93

⁴Corollary 5 of Dummit and Foote §4, p. 121

Problem 2.4. Let (G, \cdot) be a finite group. Show that there exists a positive integer n such that G is isomorphic to a subgroup of A_n , the alternating group on n letters. [Hint: Show that A_n contains a copy of S_{n-1} when $n \geq 3$.]

Proof. Let $n - 2 := |G|$. If $n - 2 = 1$ or 2 , $G \cong 0$ (the trivial group) or $G \cong Z_2$, both of which are exactly A_1 and A_2 . Suppose $n - 2 \geq 3$. By Cayley's theorem, G imbeds into S_{n-1} . Now, define a homomorphism

$$\varphi(\sigma) := \begin{cases} \sigma & \text{if } \sigma \text{ is even} \\ \sigma(n+1 \ n+2) & \text{if } \sigma \text{ is odd} \end{cases}.$$

We check that this is in fact a homomorphism. Let $\sigma, \tau \in G$. Then

$$\varphi(\sigma\tau) = \begin{cases} \sigma\tau & \text{if } \sigma\tau \text{ is even} \\ \sigma\tau(n+1 \ n+2) & \text{if } \sigma\tau \text{ is odd} \end{cases}.$$

But $\sigma\tau$ is odd if and only if σ or τ is odd and $\sigma\tau$ is even if and only if τ is even. ■

Problem 2.5. Let (G, \cdot) be a group of order $|G| = 200$.

- (a) Show that G is solvable.
- (b) Show that G is the semidirect product of two p -subgroups.

Proof. (a) First we factor the order of the group G , $|G| = 200 = 2^3 \cdot 5^2$. Now we will make use of Sylow's theorem to show that G has at least one normal p -subgroup.

(b) ■

Problem 2.6. Let $(R, +, \cdot)$ and $(S, +, \cdot)$ be commutative rings with $1 \neq 0$, and let $\varphi: R \rightarrow S$ be a surjective ring homomorphism. Assuming that R is local, i.e., it has a unique maximal ideal, show that S is also local.

Proof. ■

Problem 2.7. Let $(R, +, \cdot)$ be a principal ideal domain.

- (a) Show that every maximal ideal in R is a prime ideal.
- (b) Must every prime ideal in R be a maximal ideal? Prove or give a counterexample.

Proof. ■

Problem 2.8. Let L/F be a Galois extension of degree $[L : F] = 2p$ where p is an odd prime.

- (a) Show that there exists a unique quadratic subfield E , i.e., $F \subset E \subset L$ and $[E : F] = 2$.
- (b) Does there exist a unique subfield K of index 2, i.e., $F \subset K \subset L$ and $[L : K] = 2$? Prove or give a counterexample.

Proof. ■

Problem 2.9. Fix a prime p , and consider the Artin-Schreier polynomial $f(x) = x^p - x - 1$.

- (a) Let $\mathbb{F}_p(f)$ be the splitting field of $f(x)$ over \mathbb{F}_p . Show that $\text{Gal}(\mathbb{F}_p(f)/\mathbb{F}_p) \cong Z_p$.

(b) Prove that $f(x)$ is irreducible in $\mathbb{Z}[x]$.

Proof.

■

Problem 2.10. Determine the Galois group of the splitting field over \mathbb{Q} of $f(x) = x^4 + 4$.

Proof.

■

3 MA 553: Midterm, Fall 2015

Problem 3.1. (a) Show, for any abelian group, the map $x \mapsto x^{-1}$ is an automorphism.

(b) Show, for any n , the dihedral group D_{2n} of order $2n$, satisfies $D_{2n} \cong Z_2 \rtimes Z_n$.

Proof. (a) Suppose G is Abelian and define the map $\varphi: G \rightarrow G$ via the rule $\varphi(x) := x^{-1}$. We show that φ is an automorphism.

First, let us check that φ is in fact a homomorphism. Take $g, h \in G$, then

$$\begin{aligned}\varphi(gh) &= (gh)^{-1} \\ &= h^{-1}g^{-1}\end{aligned}$$

but since G is Abelian, the latter is just

$$\begin{aligned}&= g^{-1}h^{-1} \\ &= \varphi(g)\varphi(h).\end{aligned}$$

Thus, φ is a homomorphism.

It is easy to see that φ is surjective: Take any $g \in G$ then $\varphi(g^{-1}) = (g^{-1})^{-1} = g$. To see that φ is injective we show that its kernel is the identity subgroup: Let $g \in \ker \varphi$ then $\varphi(g) = g^{-1} = e$ implies that $e = gg^{-1} = ge = g$. Thus, $\ker \varphi = \{e\}$ and φ is injective. Thus, φ is an automorphism of G .

(b) First, note that the subgroups generated by s and r are cyclic and hence isomorphic to Z_2 and Z_n , respectively. Moreover, since $[D_{2n} : \langle r \rangle] = 2$ is the smallest prime dividing the order of D_{2n} , $\langle s \rangle \triangleleft D_{2n}$. Lastly, note that $\langle s \rangle \cap \langle r \rangle = \{e\}$. By part (a), the map given by $s \mapsto srs^{-1} = r^{-1}$ gives homomorphism $\varphi: Z_2 \rightarrow \text{Aut}(Z_n)$. Thus, $D_{2n} = \langle s \rangle \langle r \rangle \cong Z_2 \rtimes Z_n$. ■

Problem 3.2. Show that there is no simple group of order $306 = 2 \cdot 3^2 \cdot 17$.

Proof. Suppose G is a finite group of order $306 = 2 \cdot 3^2 \cdot 17$. We will show that one of n_2 , n_3 , or n_{17} equals 1.

By Sylow's theorem, $n_p \equiv 1 \pmod{p}$ and $n_p \mid m$ where $|G| = p^\alpha m$. Thus, we have:

- $n_2 = 1, 3, 3^2, 17, 3 \cdot 17$, or $3^2 \cdot 17$;
- $n_3 = 1, 34$;
- $n_{17} = 1, 18$.

Seeking a contradiction, suppose that none of n_2 , n_3 , or n_{17} equal 1. Then, at least, $n_2 = 3$, $n_3 = 34$, and $n_{17} = 18$. This means that there are $1 + 3 + 16 \cdot 18 = 302$ elements of order 1, 2, and 17. But there are at least 8 elements of order 3 in the remaining Sylow 3-subgroups, pushing this total to 310 which is absurd. Thus, at least one of n_2 , n_3 , or n_{17} equals 1. ■

Problem 3.3. Suppose R is a ring with identity, and I , J , and K are (two-sided) ideals of R with $K \subset I \cup J$. Prove that either $K \subset I$ or $K \subset J$.

Proof. We shall proceed by contradiction. Suppose that $K \not\subset I$ and $K \not\subset J$. Then there exists elements $a, b \in K$ such that $a \notin I$ and $b \notin J$. Now, consider the element $a - b \in K$. Since $K \subset I \cup J$, then $a - b \in I$ or $a - b \in J$. Without loss of generality, suppose that $a - b \in I$. Then $(a - b) + b = a \in I$ since I is additively closed. This is a contradiction. Thus, $K \subset I$ or $K \subset J$. ■

Problem 3.4. Let R and S be rings and suppose that $\varphi: R \rightarrow S$ is a ring homomorphism. Let I be an ideal of R and J an ideal of S .

- (a) Show that $\varphi^{-1}(J) := \{r \in R \mid \varphi(r) \in J\}$ is an ideal in R .
- (b) Show that if φ is surjective, then $\varphi(I) := \{\varphi(r) \mid r \in I\}$ is an ideal in S .
- (c) Given an example where φ is not surjective and $\varphi(I)$ is not an ideal in S .

Proof. (a) We need to show two things: Let $r \in R$ and $a \in \varphi^{-1}(J)$ then $\varphi(ra) = \varphi(r)\varphi(a)$, but $\varphi(a) \in J$ so $\varphi(r)\varphi(a) \in J$. Thus, $ra \in \varphi^{-1}(J)$. Lastly, we show $\varphi^{-1}(J)$ is an additive subgroup, namely, for $a_1, a_2 \in \varphi^{-1}(J)$, we have $\varphi(a_1), \varphi(a_2) \in J$ so $\varphi(a_1) + \varphi(a_2) = \varphi(a_1 + a_2) \in J$. Thus, $a_1 + a_2 \in \varphi^{-1}(J)$. Thus, $\varphi^{-1}(J)$ is an ideal in R .

(b) Suppose φ is surjective. Then, for every element $s \in S$, there exist an element $r \in R$ such that $s = \varphi(r)$. Now, let $a \in \varphi(I)$ and $s \in S$. Then $\varphi(b) = a$ for some $b \in I$ and $\varphi(r) = s$ for some $r \in R$. Thus, $\varphi(rb) = sa \in \varphi(I)$. Lastly, if $a_1, a_2 \in \varphi(I)$ then $\varphi(b_1) = a_1$ and $\varphi(b_2) = a_2$ for $b_1, b_2 \in I$ so $b_1 + b_2 \in I$ implies that $\varphi(b_1 + b_2) = \varphi(b_1) + \varphi(b_2) \in \varphi(I)$. Thus, $\varphi(I)$ is an ideal of S .

(c) Consider the map $\varphi: Z_4 \rightarrow Z_2 \times Z_2$ given by the rule $\varphi(s) = (s, s)$. This map is a homomorphism since for any $s_1, s_2 \in Z_4$, we have

$$\begin{aligned} \varphi(s_1 + s_2) &= (s_1 + s_2, s_1 + s_2) & \varphi(s_1 s_2) &= (s_1 s_2, s_1 s_2) \\ &= (s_1, s_1) + (s_2, s_2) & &= (s_1, s_1)(s_2, s_2) \\ &= \varphi(s_1) + \varphi(s_2) & &= \varphi(s_1)\varphi(s_2). \end{aligned}$$

But note that φ is not surjective since $\varphi(Z_4) = \{(0, 0), (1, 1)\}$. Moreover, the latter is not an ideal since for $(1, 0) \in Z_2 \times Z_2$, $(1, 0)(1, 1) = (1, 0) \notin \varphi(Z_4)$. ■

Problem 3.5. (a) Let R be a commutative ring with identity $1 \neq 0$. Suppose that, for every $r \in R$, there is some $n = n_r \geq 2$ so that $r^n = r$. Prove that every prime ideal of R is maximal.

- (b) Suppose R is a unique factorization domain, $p \in R$ is irreducible, and \mathfrak{p} is a prime ideal with $0 \subsetneq \mathfrak{p} \subset (p)$. Show $\mathfrak{p} = (p)$. (*Hint:* Prove that \mathfrak{p} can be generated by irreducible elements.)

Proof. (a) Let $\mathfrak{p} \in \text{Spec}(R)$. Then R/\mathfrak{p} is an integral domain. Now, let $r \in R \setminus \mathfrak{p}$ and $\pi: R \rightarrow R/\mathfrak{p}$ be the canonical projection. Put $\bar{r} := \pi(r)$. Then since $r^n = r$ for some $n \geq 2$ we have

$$\pi(r^n) = (\bar{r})^n(\bar{r})^n = \bar{r} = \pi(r).$$

Thus, $\bar{r}(\bar{r}^{n-1} - \bar{1}) = 0$ implies $\bar{r} = \bar{0}$ or $\bar{r}^{n-1} = \bar{1}$. But $r \notin \mathfrak{p}$ so $\bar{r} \neq \bar{0}$. Thus, $\bar{r}^{n-1} = \bar{1}$ and we see that \bar{r} is a unit. Thus, R/\mathfrak{p} is a field which implies that \mathfrak{p} is maximal.

(b) First note that if p is irreducible in R then it is prime. We will show that \mathfrak{p} contains a principal prime ideal. Let $a \in \mathfrak{p}$. Then, since R is a UFD, we may write $a = p_1 \cdots p_n$ for p_1, \dots, p_n irreducible in R . Hence, each p_i is prime in R and (p_i) is a prime ideal. Moreover, since $a = p_1 \cdots p_n \in \mathfrak{p}$, $p_k \in \mathfrak{p}$ for some $1 \leq k \leq n$. Thus, $(p_k) \subset \mathfrak{p}$. Hence, we have $(p_k) \subset \mathfrak{p} \subset (p)$. But this implies $p_k = rp$ for some $r \in R$. Since p_k is irreducible, r must be a unit so $(p_k) = (p)$ which implies that $\mathfrak{p} = (p)$. ■

4 MA 553: Final, Fall 2015

Problem 4.1. Let G be a finite non-Abelian group, and let $Z(G)$ be the center of G . Prove that $|Z(G)| \leq |G|/4$.

Proof. Seeking a contradiction, suppose $4 > [G : Z(G)]$. Since $Z(G) \triangleleft G$, we have $G/Z(G)$ is a group of order 1, 2, or 3. Thus, $G/Z(G) \cong Z_1, Z_2$, or Z_3 all of which are cyclic. This implies that G is Abelian. This is a contradiction. ■

Problem 4.2. Let

$$G = \text{SL}_2(\mathbf{Z}/(5)) := \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} \mid a, b, c, d \in \mathbf{Z}/(5), \text{ and } ad - bc \equiv 1 \pmod{5} \right\}.$$

(a) Show $|G| = 120$.

(b) Show $N := \{ \begin{bmatrix} 1 & b \\ 0 & 1 \end{bmatrix} \mid b \in \mathbf{Z}/(5) \}$ is a Sylow 5-subgroup of G .

Suppose a, b, c have been chosen. Then $d \equiv (ab - 1)d^{-1} \pmod{5}$. Then, there are $5^2 + 4 = 28$ possible choices for these and 4 possible ways to choose fix one of a, b, c, d . Thus, there are at least $4 \cdot 28 = 2^2 \cdot 3 \cdot 7$.

(c) Find the number of Sylow 5-subgroups of G .

Proof. (a) We know the since of $\text{GL}_2(\mathbf{Z}/(5))$. This is $(5^2 - 1)(5^2 - 5) = 24 \cdot 20 = 2^5 \cdot 3 \cdot 5$.

(b) It suffices to show that the order of N is 5 since 1 is the largest exponent of 5 dividing $120 = 2^3 \cdot 3 \cdot 5$. But this is clear, since N must satisfy $1 - b \cdot 0 \equiv 1 \equiv 1 \pmod{5}$ which is true for any $b \in \mathbf{Z}$. Hence, there are 5 elements in N . Thus, N is a Sylow 5-subgroup.

(c) By Sylow's theorem, there are $n_5 = 1$ or 6. We will show that N is not normal in $\text{SL}_2(\mathbf{Z}/(5))$ so that $n_5 \neq 1$. Let $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \text{SL}_2(\mathbf{Z}/(5))$. Then, for any matrix in N we have

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} = \begin{bmatrix} 1 - ac & a^2 \\ -bc & 1 + ba \end{bmatrix}$$

is in N if and only if $ac = ba = 0$ and $-bc = 0$. But $ad \equiv 1 + bc \pmod{5}$. Implies $bc = 0$ so $b = 0$ or $c = 0$ so either $b = 0$ and $c = 0$ or $c = 0$. The former implies that $ad = 1 \equiv 1 \pmod{5}$ so $a = d = 1$. This would imply that $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$. Thus, $N \not\triangleleft \text{SL}_2(\mathbf{Z}/(5))$ so $n_5 = 6$. ■

Problem 4.3. Suppose R is a UFD and F is the quotient field of R . Let $f(X) \in R[X]$ and suppose $f(X)$ factors as a product of lower degree polynomials in $F[X]$. Show $f(X)$ factors as a product of lower degree polynomials in $R[X]$.

Proof. This is an important result called *Gauß's lemma* and is proven in Dummit and Foote more or less as follows:

Suppose $f(X)$ factors as $f(X) = g(X)h(X)$ for polynomials $g, h \in F[X]$ with $\deg(g), \deg(h) < \deg(f)$. Then each coefficient $\{a_i\}, \{b_i\}$ of g and h , respectively, is in F . Thus, clearing denominators, we have $df(X) = g'(X)h'(X)$ for $g'(X), h'(X) \in R[X]$. If d is a unit in R we are done since $f(X) = d^{-1}df(X) = d^{-1}g'(X)h'(X)$.

Suppose d is not a unit. Then, since R is a UFD, we may write d as the product $d = d_1 \cdots d_n$ of irreducible elements $d_i \in R$. Since d_1 is irreducible and R is a UFD, then d_1 is prime so the ideal generated by d_1 is prime. Thus, $(R/(d_1))[X]$ is a domain and

$$\bar{0} = \overline{df(X)} = \bar{d} \cdot \overline{f(X)} = \overline{g'(X)h'(X)} = \overline{g'(X)} \cdot \overline{h'(X)}.$$

Thus, either $\overline{g'(X)} = \bar{0}$ or $\overline{h'(X)} = \bar{0}$ since $(R/(d_1))[X]$ is a domain. Without loss of generality, suppose $\overline{g'(X)} = \bar{0}$. Then, $(1/d_1)g'(X) \in R[X]$ so, dividing over F , we have $(d_2 \cdots d_n)f(X) = ((1/d_1)g'(X))h'(X)$ in $R[X]$. Proceeding recursively in this fashion until, we may arrive at $f(X) = G(X)H(X)$ where $G(X), H(X) \in R[X]$. Since we reduced by elements in the subring R , $\deg(G) = \deg(g)$ and $\deg(H) = \deg(h)$ so that $f(X)$ factors as a product of polynomials of lower degree in $R[X]$, as desired. ■

Problem 4.4. Let R be a commutative ring. Recall an element $a \in R$ is *nilpotent* if $r^n = 0$ for some $n \geq 1$. Let $I = \{a \in R \mid a \text{ is nilpotent}\}$.

- (a) Show I is an ideal. (*Hint:* To show I is an additive subgroup, show if $x, y \in I$ there is an $N > 0$ so that $(x - y)^N = 0$ using the binomial expansion of $(x - y)^N$.)
- (b) Show I is contained in any prime ideal of R .

Proof. (a) In fact, one can show that $I = \text{Nil}(R) = \bigcap_{\mathfrak{p} \in \text{Spec}(R)} \mathfrak{p}$, i.e., I is the intersection of all prime ideals in R hence, an ideal.

First, we show that R is multiplicatively closed. Let $r \in R$ and $a \in I$. Then $(ar)^n = a^n r^n$ since R is commutative. But $r^n = 0$, so $(ar)^n = a^n \cdot 0 = 0$. Thus $ar \in I$.

Next, we show that it is additively closed. Suppose $a, b \in I$. Then $a^m = 0$ and $b^n = 0$ for some positive integer m and n . Suppose, without loss of generality, that $n \geq m$. Let $N = n + m$. Then

$$\begin{aligned} (a + b)^N &= (a + b)^{n+m} \\ &= \sum_{i=1}^{n+m} \binom{n+m}{i} a^i b^{n+m-i}. \end{aligned}$$

Now, note that if $k \geq n$, $x^k = 0$ so $\binom{n+m}{k} a^k b^{n+m-k} = 0$. On the other hand, if $k < n$, $n+m-k > m$ so $b^{n+m-k} = 0$ so $\binom{n+m}{k} a^k b^{n+m-k} = 0$. In either case, we see that $\binom{n+m}{k} a^k b^{n+m-k} = 0$ so $(a+b)^N = 0$. Thus, $a + b \in I$. Hence, I is an ideal.

- (b) Let \mathfrak{p} be a maximal ideal of R . Now, since \mathfrak{p} is an ideal of R , $0 \in \mathfrak{p}$. Moreover, for any $a \in I$, $a^n = 0$ for some positive integer n . Thus, $a^n = 0 \in \mathfrak{p}$. But \mathfrak{p} is a prime ideal. Thus, $a \in \mathfrak{p}$ or $a^{n-1} \in \mathfrak{p}$. If the former, we are done. In the later, $a^{n-1} \in \mathfrak{p}$ so $a \in \mathfrak{p}$ or $a^{n-2} \in \mathfrak{p}$. Proceeding recursively in this manner, we have $a \in \mathfrak{p}$. Thus, $I \subset \mathfrak{p}$, as desired. ■

Problem 4.5. Let $\alpha \in \mathbf{C}$ be algebraic over \mathbf{Q} , and let $f(X) \in \mathbf{Q}[x]$ be its minimal polynomial. Let $\sqrt{\alpha}$ be a square root of α , and let $g(X) \in \mathbf{Q}[X]$ be its minimal polynomial.

- (a) Show $\deg f(X)$ divides $\deg g(X)$.
- (b) Show $\sqrt{\alpha} \in \mathbf{Q}(\alpha)$ if and only if $f(X^2)$ is reducible in $\mathbf{Q}[X]$.

Proof. (a) This follows directly from the tower of fields theorem. Let $\mathbf{Q}(f)$ denote the splitting field of f . Then, $\alpha \in \mathbf{Q}(f)$ so that $\mathbf{Q}(g) \supset \mathbf{Q}(f)$. Thus, we have

$$[\mathbf{Q}(g) : \mathbf{Q}] = [\mathbf{Q}(g) : \mathbf{Q}(f)][\mathbf{Q}(f) : \mathbf{Q}] = k \cdot \deg(f)$$

Thus, $\deg(f) \mid \deg(g)$.

(b) \implies Suppose that $\sqrt{\alpha} \in \mathbf{Q}(\alpha)$. Then $f(\sqrt{\alpha}^2) = f(\alpha) = 0$ hence, $f(X^2)$ has a root in \mathbb{Q} hence, is reducible.

\Leftarrow Conversely, suppose that $f(X^2)$ is reducible. Then, we may write $f(X^2) = \prod_{i=1}^k f_i(X)$ where $f_i \in \mathbf{Q}[X]$ is irreducible. Now, each of these factors, f_i , have degree less than $2n$ where $n := \deg(f(X^2))$. Suppose

$$f_i(X) = X^k + a_{k-1}X^{k-1} + \cdots + a_0$$

for $a_{k-1}, \dots, a_0 \in \mathbf{Q}$. Then

$$f_i(\sqrt{\alpha}) = \alpha^{k/2} + a_{k-1}\alpha^{(k-1)/2} + \cdots + a_0.$$

■

Problem 4.6. Let $f(X) = X^6 + 3 \in \mathbf{Q}[X]$.

(a) Let α be a root of $f(X)$. Prove $(\alpha^3 + 1)/2$ is a primitive 6th root of unity.

(b) Determine the Galois group of $f(X)$ over \mathbf{Q} .

Proof. (a) To show that $(\alpha^3 + 1)/2$ is a 6th root of unity, suffices to show that $\Phi_6((\alpha^3 + 1)/2) = 0$ where Φ_6 is the 6th cyclotomic polynomial. Recall that we may derive the n th cyclotomic polynomial via the formula

$$X^n - 1 = \prod_{d \mid n} \Phi_d(X)$$

so that

$$X^6 - 1 = \Phi_1(X)\Phi_2(X)\Phi_3(X)\Phi_6(X) = (X - 1)(X + 1)(X^2 + X + 1)$$

and we have

$$\begin{aligned} \Phi_6(X) &= \frac{X^6 - 1}{(X - 1)(X + 1)(X^2 + X + 1)} \\ &= X^2 - X + 1. \end{aligned}$$

Thus,

$$\begin{aligned} \Phi_6((\alpha^3 + 1)/2) &= \frac{1}{4}(\alpha^3 + 1)^2 - \frac{1}{2}(\alpha^3 + 1) + 1 \\ &= \frac{1}{4}\alpha^6 + \frac{1}{2}\alpha^3 + \frac{1}{4} - \frac{1}{2}\alpha^3 - \frac{1}{2} + 1 \\ &= \frac{1}{4}\alpha^6 + \frac{3}{4} \\ &= \frac{1}{4}(\alpha^6 + 3) \\ &= 0. \end{aligned}$$

Thus, $(\alpha^3 + 1)/2$ is 6th root of unity.

To show that $(\alpha^3 + 1)/2$ is in fact a primitive root of unity, we need to show that 6 is the smallest integer such that $((\alpha^3 + 1)/2)^6 = 1$. And that is too much work.

(b) Put $\zeta_6 := (\alpha^3 + 1)/2$. The roots of the polynomial are $\sqrt[6]{3}, \zeta_6 \sqrt[6]{3}, \dots, \zeta_6^5 \sqrt[6]{3}$. Hence, the splitting field of f contains $\sqrt[6]{3}$ and a primitive sixth root of unity $(\alpha^3 + 1)/2$. Since $\deg(\Phi_6) = 2$, and $\sqrt{3} \in \mathbf{Q}(\Phi_6)$, the minimal polynomial of $\sqrt[6]{3}$ over $\mathbf{Q}(\Phi_6)$ is $X^3 - \sqrt{3}$. Hence, the degree of the extension

$$[\mathbf{Q}(f) : \mathbf{Q}] = [\mathbf{Q}(f) : \mathbf{Q}(\Phi_6)][\mathbf{Q}(\Phi_6) : \mathbf{Q}] = 3 \cdot 2 = 6.$$

Thus, the Galois group of $\mathbf{Q}(f)/\mathbf{Q}$ is order 6.

Moreover, the Galois group acts transitively on the roots of f so there are automorphism of the splitting field fixing the subfields $\mathbf{Q}(\Phi_6)$ and \mathbf{Q} . These are the automorphism

$$\sigma : \alpha \mapsto -\alpha \quad \text{and} \quad \tau : \alpha \mapsto \zeta_6 \alpha.$$

Note that σ has order 2 and τ has order 3 so that $\text{Gal}(\mathbf{Q}(f)/\mathbf{Q}) \cong D_6$. ■

Problem 4.7. Let $R := (\mathbf{Z}/(3))[X]$. Consider the ideals $I_1 := (X^2 + 1)$, and $I_2 := (X^2 + X + 2)$. For $i = 1, 2$ we set $F_i = R/I_i$.

(a) Show F_1 and F_2 are fields.

(b) Are F_1 and F_2 isomorphic? If not, why not, and if so give an isomorphism from F_1 to F_2 .

Proof. (a) Recall by some theorem in chapter 13 that $F[X]/(f)$ is a field if and only if f is irreducible. Therefore, it suffices to show that $X^2 + 1$ and $X^2 + X + 2$ are irreducible over $\mathbf{Z}/(3)$. To that end, since the degree of these polynomials is two, it suffices to show that they have no roots over $\mathbf{Z}/(3)$.

In the case of $X^2 + 1$, we have $0^2 + 1 \neq 0$, $1^2 + 1 = 1 \neq 0$, and $2^2 + 1 = 4 + 1 = 1 + 1 = 2 \neq 0$. Thus, $X^2 + 1$ is irreducible.

In the case of $X^2 + X + 2$, we have $0^2 + 0 + 2 = 2 \neq 0$, $1 + 1 + 2 = 1 \neq 0$, and $4 + 2 + 2 = 8 = 2 \neq 0$.

Thus, F_1 and F_2 are fields.

(b) By the classification theorem for finite fields, both F_1 and F_2 are an extension over $\mathbf{F}_3 = \mathbf{Z}/(3)$ of degree 2 hence, both are isomorphic to \mathbf{F}_{3^2} . In particular, they are isomorphic to each other. Let α be a root of $X^2 + 1$ and β be a root of $X^2 + X + 2$. Then the map $\alpha \mapsto \beta$ which fixes \mathbf{F}_3 is an isomorphism. It suffices to show that this is an injective homomorphism. First, this is a homomorphism since for any $x, y \in F_1$, if $x, y \in \mathbf{F}_3$, $\varphi(x + y) = x + y = \varphi(x) + \varphi(y)$. If one of x or y not in \mathbf{F}_3 , suppose x , then $x = \alpha^k + x'$ for $x' \in \mathbf{F}_3$ so

$$\varphi(\alpha^k + x' + y) = \beta^k + x' + y = \varphi(\alpha^k + x') + \varphi(y)$$

etc., thus this is an isomorphism.

To see that this map is injective, note that $\ker \varphi = \{0\}$. Thus, φ is an isomorphism. ■

Problem 4.8. Suppose F is a field, $K = F(\alpha)$ is a Galois extension, with cyclic Galois group generated by $\sigma(\alpha) := \alpha + 1$. Show that $\text{ch}(K) = p \neq 0$, and $\alpha^p - \alpha \in F$.

Proof. Suppose that the Galois group of K is cyclic of order $n > 1$. Then,

$$\sigma^n(\alpha) = \alpha = \alpha + n.$$

Thus, $0 = \alpha - \alpha = n \in F$ so $\text{ch}(F)$ is prime since the order of a field is always prime.

Lastly, note that $\alpha^p - \alpha = \alpha(\alpha^{p-1} - 1)$ since α is the root of the polynomial $x^p - x$. ■

5 Qualifying Exam, January 2000

Problem 5.1. Find all groups of order $7 \cdot 11^3$ which have a cyclic subgroup of order 11^3 .

Proof. Suppose G is a group of order $7 \cdot 11^3$. By Sylow's theorem, $n_{11} \equiv 1 \pmod{11}$ and $n_{11} \mid 7$, thus $n_{11} = 1$ and we see that G must have a unique, therefore normal, Sylow 11-subgroup P of order 11^3 . Also by Sylow's theorem, we see that $n_7 = 1$ or $11^3 = 1331$ (what an outrageous number!!!).

If $n_7 = 1$, again the Sylow 7-subgroup Q is unique hence, normal in G and we must have $PQ = QP = G$ (since $P \cap Q = \{e\}$ and $|PQ| = |P||Q|/|P \cap Q| = 11^3 \cdot 7/1 = |G|$). Thus, $G \cong Z_7 \times Z_{11^3}$.

Otherwise, $n_7 = 11^3$. Thus, there are $6 \cdot 11^3 + 1$ elements of order 7 plus the identity plus $11^3 - 1$ elements in P . Thus, there are a total of $6 \cdot 11^3 + 1 + 11^3 - 1 = 7 \cdot 11^3$ elements of order 7, in Q , plus the identity. No contradiction here. But we still have $P \cap Q = \{e\}$ for any $Q \in \text{Syl}_7(G)$. Therefore, I suspect that the only other (nonabelian) group that has a cyclic subgroup of order 11^3 must be the semidirect product $Z_7 \rtimes Z_{11^3}$. ■

Problem 5.2. Let R be a ring with identity 1 and consider the following two conditions:

- (i) If $a, b \in R$ and $ab = 0$, then $ba = 0$;
- (ii) If $a, b \in R$ and $ab = 1$, then $ba = 1$;
- (a) Show that (i) implies (ii).
- (b) Show by example that (ii) does not imply (i).

Proof. (ii) $\not\Rightarrow$ (i) ■

Problem 5.3. Let F be a field. Suppose that E/F is a Galois extension, and that L/F is an algebraic extension with $L \cap E = F$. Let EL be the composite field, i.e., the subfield of an algebraic closer \bar{F} of F generated by E and L .

- (a) Show EL/L is a Galois extension.
- (b) Show that there is an injective homomorphism

$$\varphi: \text{Gal}(EL/L) \hookrightarrow \text{Gal}(E/F).$$

Find the fixed field of the image of φ .

- (c) Show that $[EL : L] = [E : F]$.
- (d) Give an example to show that the conclusion of (c) is false if we do not assume that E/F is Galois.

Proof. ■

Problem 5.4. Let G be a finite group. Let p be a prime and suppose that $|G| = p^k m$, with $k \geq 1$ and $p \nmid m$. Let X be the collection of all subsets of G of order p^k . Then G acts on X by left multiplication, i.e., $g \cdot A = \{ga \mid a \in A\}$. For $A \in X$ denote by H_A the stabilizer in G of A . Show that $|H_A| \mid p^k$.

Proof.

■

Problem 5.5. Let $R = \mathbf{Z} + X\mathbf{Q}[X] \subset \mathbf{Q}[X]$ be the ring consisting of polynomials with rational coefficients whose constant term is an integer.

- (a) Prove that R is an integral domain, with units 1 and -1 .
- (b) Show that x is not an irreducible element of R .
- (c) Let $(X) := Rx$ be the ideal of R generated by X . Describe $R/(X)$ and show that $R/(X)$ is not an integral domain. What can you conclude about X ?

Proof.

■

6 Qualifying Exam, January 2011

Problem 6.1. Let

$$G = \mathrm{SL}_2(\mathbf{Z}/(5)) := \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} \mid a, b, c, d \in \mathbf{Z}/(5), \text{ and } ad - bc \equiv 1 \pmod{5} \right\}.$$

- (a) Show $|G| = 120$.
- (b) Show

$$N := \left\{ \begin{bmatrix} 1 & b \\ 0 & 1 \end{bmatrix} \mid b \in \mathbf{Z}/(5) \right\}$$

is a Sylow 5-subgroup of G .

- (c) Find the number of Sylow 5-subgroups of G .

Proof. ■

Problem 6.2. (a) Let G be a group, H a subgroup of G with $[G : H] = 2$. Suppose K is a subgroup of G of odd order. Show $K \subset H$.

- (b) Let G be a finite group and suppose there is a sequence of subgroups

$$G_0 := G \supset G_1 \supset G_2 \supset \cdots \supset G_n := H,$$

with $[G_i : G_{i+1}] = 2$ for $i \in \{1, \dots, n-1\}$. Suppose H has odd order. Show $H \triangleleft G$.

- (c) Suppose $|G| = 2^n m$, with m odd. Suppose G has a normal subgroup H of order m . Show there is a sequence of subgroups $G_0 := G \supset G_1 \supset \cdots \supset G_n := H$, with $[G_i : G_{i+1}] = 2$, for all i .

Proof. ■

Problem 6.3. Let R be a commutative ring with identity $1 \neq 0$, and let I be an ideal of R . Define $\mathrm{rad}(I)$ to be the intersection of all maximal ideals containing I , with the convention $\mathrm{rad}(R) = R$. Let $\sqrt{I} := \{r \in R \mid r^n \in I \text{ for some } n > 0\}$.

- (a) Prove $\mathrm{rad}(I)$ is an ideal of R containing I .
- (b) Prove $\sqrt{I} \subset \mathrm{rad}(I)$.
- (c) Let F be a field, set $R = F[X]$, and let $I = (f)$, for some nonzero polynomial $f(X) \in R$. Describe $\mathrm{rad}(I)$ in this instance.

Proof. ■

Problem 6.4. Let S be the subring of $\mathbf{C}[X] \times \mathbf{C}[Y]$ consisting of pairs (f, g) with $f(0) = g(0)$.

- (a) Let $\varphi: \mathbf{C}[X, Y] \rightarrow S$ be defined by $\varphi(h) = (f, g)$, where $f(X) = h(x, 0)$, and $g(Y) = h(0, Y)$. Prove φ is a surjective homomorphism.
- (b) Prove $\mathbf{C}[X, Y]/(X, Y) \cong S$.

- (c) Use (b) to describe the prime ideals of S . Be sure to justify your answer.

Proof. ■

Problem 6.5. Let p be a prime, let $F = \mathbf{F}_p$ be the field of p elements and $K = \mathbf{F}_{p^{10}}$ be the unique extension of F with p^{10} elements.

- (a) Find all subfields of K . Make sure to justify your answer.
- (b) Find a formula for the number of monic irreducible polynomials of degree 10 in $F[X]$. Justify your answer.

Proof. ■

Problem 6.6. Let $f(X) = (X^2 - 3)(X^3 - 7) \in \mathbf{Q}[X]$. Let K be the splitting field of $f(X)$ over \mathbf{Q} .

- (a) Find the degree of K over \mathbf{Q} .
- (b) Classify the Galois group $\text{Gal}(K/\mathbf{Q})$.
- (c) Find all subfields E of K so that E/\mathbf{Q} is a quadratic extension.

Proof. ■
