Problem 8.1

Show that the function

$$u(x,t) := \sum_{k=-\infty}^{\infty} (-1)^k \Phi(x-2k,t)$$

where

$$\Phi(x,t) = \frac{\mathrm{e}^{-x^2/4t}}{\sqrt{4\pi t}}$$

is positive for $|x| < 1$, $t > 0$.
(*Hint:* Show that u satisfies $u_t = u_{xx}$ for $t > 0$,

$$\begin{cases} u = 0 & \text{on } \{\, |x| = 1 \,\} \times \{\, t \geq 0 \,\}, \\ u = \delta_0 & \text{on } \{\, |x| = 1 \,\} \times \{\, t = 0 \,\}. \end{cases}$$

Then, carefully apply the maximum/minimum principle in a domain $\{\, |x| \leq 1 \,\} \times \{\, \varepsilon \leq t \leq T \,\}$ for small $\varepsilon > 0$ and large $T > 0$ pass to the limit as $\varepsilon \to 0^+$ and $T \to \infty$.)

Solution. ∎

Problem 8.2 (Tikhonov's example)

Let

$$g(t) := \begin{cases} \mathrm{e}^{-t^2} & t > 0, \\ 0 & t \leq 0. \end{cases}$$

Then $g \in C^\infty(\mathbb{R})$ and we define

$$u(x,t) := \sum_{k=0}^{\infty} \frac{g^{(k)}(t)}{(2k)!} x^{2k}.$$

Assuming that the series is convergent, show that $u(x,t)$ solves the heat equation in $\mathbb{R} \times (0,\infty)$ with the initial condition $u(x,0) = 0$, $x \in \mathbb{R}$. Why doesn't this contradict the uniqueness theorem for the initial value problem.)

Solution. ■

Problem 8.3

Evaluate the integral

$$\int_{-\infty}^{\infty} \cos(ax)\mathrm{e}^{-x^2}\, dx, \qquad (a > 0).$$

(*Hint:* Use the separation of variables to find the solution of the corresponding initial-value problem for the heat equation.)

Solution. ■
