MA 519: Homework 6

Max Jeter, Carlos Salinas October 6, 2016

Problem 6.1 (Handout 8, # 2)

Identify the parameters n and p for each of the following binomial distributions:

- (a) # boys in a family with 5 children;
- (b) # correct answers in a multiple choice test if each question has a 5 alternatives, there are 25 questions, and the student is making guesses at random.

SOLUTION. For part (a), the distribution is binomial with k being the number of children in a given family and p the probability that a child is born, say, male. In this case, we can reasonably assume that p = 0.5. Thus, the binomial distribution is given by Binom(5, 0.5).

For part (b), we use similar reasoning and we have Binom(25, 0.2) where k = 25 is the number of questions and p = 1/5 = 0.2 the probability of guessing a question correctly.

MA 519: Homework 6

Problem 6.2 (Handout 8, # 10)

A newsboy purchases papers at $20\mathfrak{e}$ and sells them for $35\mathfrak{e}$. He cannot return unsold papers. If the daily demand for papers is modeled as a Binom(50,0.5) random variable, what is the optimum number of papers the newsboy should purchase?

SOLUTION. Let $X \sim \text{Binom}(50, 0.5)$ denote the daily demand for papers. Let S denote the number of newspapers the newsboy sells and let B denote the number of newspapers the newsboy buys. Then, we want to optimize the quantity

$$P = 0.35 \cdot S - 0.2 \cdot B$$

Problem 6.3 (Handout 8, # 12)

How many independent bridge dealings are required in order for the probability of a preassigned player having four aces at least once to be 1/2 or better? Solve again for some player instead of a given one.

Problem 6.4 (Handout 8, # 13)

A book of 500 pages contains 500 misprints. Estimate the chances that a given page contains at least three misprints.

Problem 6.5 (Handout 8, # 14)

Colorblindness appears in 1 per cent of the people in a certain population. How large must a random sample (with replacements) be if the probability of its containing a colorblind person is to be 0.95 or more?

Solution.

Problem 6.6 (Handout 8, # 15)

Two people toss a true coin n times each. Find the probability that they will score the same number of heads.

Problem 6.7 (Handout 8, # 16)

Binomial approximation to the hypergeometric distribution. A population of TV elements is divided into red and black elements in the proportion p:q (where p+q=1). A sample of size n is taken without replacement. The probability that it contains exactly k red elements is given by the hypergeometric distribution of II, 6. Show that as $n \to \infty$ this probability approaches Binom(n, p).

Solution.

Problem 6.8 (Handout 9, # 3)

Suppose X, Y, Z are mutually independent random variables, and E(X) = 0, E(Y) = -1, E(Z) = 1, $E(X^2) = 4$, $E(Y^2) = 3$, $E(Z^2) = 10$. Find the variance and the second moment of 2Z - Y/2 + eX, where e is the number such that $\ln e = 1$.

Problem 6.9 (Handout 9, # 14)

($Variance\ of\ Product$). Suppose $X,\ Y$ are independent random variables. Can it ever be true that $Var(XY) = Var(X)\,Var(Y)$? If it can, when?

Solution.
