#### PROBLEM 5.1 (HATCHER §2.2, Ex. 3)

Let  $f: S^n \to S^n$  be a map of degree zero. Show that there exists points  $x, y \in S^n$  with f(x) = x and f(y) = -y. Use this to show that if F is a continuous vector field defined on the unit ball  $D^n$  in  $\mathbb{R}^n$  such that  $F(x) \neq 0$  for all x, then there exists a point on  $\partial D$  where F points radially outward and another point on  $\partial D^n$  where F points radially inward.

*Proof.* Since  $\deg f = 0 \neq (-1)^n = \deg a$ , then  $f \not\simeq a$  and so must have a fixed point  $x \in S^n$ . Now, consider the map  $g := a \circ f$ . Since  $\deg g = \deg a \circ f = (\deg a)(\deg f) = 0$ , g must have a fixed point  $y \in S^n$ . Since  $g(y) = a \circ f(y) = y$ , then f(y) = -y.

Suppose F is a continuous nonzero vector field on  $S^n$ , i.e., a map  $S^n \to \mathbf{R}^n$  which assigns to each point  $x \in S^n$  a tangent vector  $\mathbf{v}(x)$  at x. Then, the map  $f : \partial D^n \to \mathbf{R}^n$  given by  $f(\mathbf{v}(x)) = \mathbf{v}(x)/\|\mathbf{v}(x)\|$  is well defined and nowhere zero.

*MA 572: Homework 5* 

#### PROBLEM 5.2 (HATCHER §2.2, Ex. 7)

For an invertible linear transformation  $f: \mathbf{R}^n \to \mathbf{R}^n$  show that the induced map  $H_n(\mathbf{R}^n, \mathbf{R}^n \setminus \{\mathbf{0}\}) \cong \widetilde{H}_{n-1}(\mathbf{R}^n \setminus \{\mathbf{0}\}) \cong \mathbf{Z}$  is id or – id according to whether the determinant of f is positive or negative. [Use Gaußian elimination to show that the matrix of f can be joined by a path of invertible matrices to a diagonal matrix with  $\pm 1$ 's on the diagonal.]

Proof. We show that  $O_n(\mathbf{R})$  is a deformation retraction of  $GL_n(\mathbf{R})$  and prove the result there. This procedure is adapted from a hint in Элементарная топология by Виро, Нецветаев и Харламов, стр. 338, номер 39.11. Suppose  $f : \mathbf{R}^n \to \mathbf{R}^n$  is an invertible linear transformation. Let  $\{\mathbf{f}_1, ..., \mathbf{f}_n\}$  be the set of columns vectors of the matrix representation F of f. By Gram-Schmidt orthogonalization construct the vectors

$$\mathbf{e}_{1} \coloneqq \lambda_{11} \mathbf{f}_{1}$$

$$\mathbf{e}_{2} \coloneqq \lambda_{21} \mathbf{f}_{1} + \lambda_{22} \mathbf{f}_{2}$$

$$\vdots$$

$$\mathbf{e}_{n} \coloneqq \lambda_{n1} \mathbf{f}_{1} + \dots + \lambda_{nn} \mathbf{f}_{n}$$

$$(5.1)$$

where the  $\lambda_{kk} > 0$  for k = 1, ..., n. Now set

$$\mathbf{g}_k(t) := t(\lambda_{n1}\mathbf{f}_1 + \lambda_{n2}\mathbf{f}_2 + \dots + \lambda_{kk-1}\mathbf{f}_{k-1}) + (t\lambda_{kk} + 1 - t)\mathbf{f}_k. \tag{5.2}$$

Let g(t, A) be the matrix whose columns are the vectors  $\mathbf{g}_k(t)$  and define a homotopy  $f_t: I \times \operatorname{GL}_n(\mathbf{R}) \to \operatorname{GL}_n(\mathbf{R})$  by mapping the pair  $(t, A) \mapsto g(t, A)$ . Continuity of H follows from the fact that H it is multiplication in  $\mathbf{R}^n$  followed by a linear mapping. It's not hard to see that  $f_t$  stays in  $\operatorname{GL}_n(\mathbf{R})$  for all t and  $f_1(A)$  is in  $\operatorname{O}_n(\mathbf{R})$ .

Last but not least, we show that  $O_n(\mathbf{R})$  consists of two connected components and that membership of f to one of these components is determined by  $\det f$ . First note that  $\det(O_n(\mathbf{R})) = \{-1,1\}$  which is disconnected in  $\mathbf{R}$ . Hence,  $O_n(\mathbf{R})$  is disconnected. If  $f \in O_n(\mathbf{R})$ , either  $\det f = 1$  or -1. Suppose it is the former. Then we construct a homotopy from f to the identity map id. Consider the homotopy

 $k(t,A) := \Big\{ At \tag{5.3}$ 

### PROBLEM 5.3 (HATCHER §2.2, Ex. 13)

Let X be the 2-complex obtained from  $S^1$  with its usual cell structure by attaching two 2-cells by maps of degrees 2 and 3, respectively.

- (a) Compute the homology groups of all the subcomplexes  $A \subset X$  and the corresponding quotient complexes X/A.
- (b) Show that  $X \simeq S^2$  and that the only subcomplex  $A \subset X$  for which the quotient map  $X \to X/A$  is a homotopy equivalence is the trivial subcomplex, the 0-cell.
