MA 519: Homework 5

Max Jeter, Carlos Salinas September 29, 2016

#### Problem 5.1 (Handout 7, # 6(d, f))

Find the variance of the following random variables

- (d) X = # of tosses of a fair coin necessary to obtain a head for the first time.
- (f) X = # matches observed in random sitting of 4 husbands and their wives in opposite sides of a linear table.

This is an example of the matching problem.

SOLUTION. Recall that the variance of a random variable can be computed as

$$Var(X) = E(X^2) - (E(X))^2.$$

For part (d), let X be as above. First, note that X takes every value on  $\mathbb{N}$ . Thus, its PMF is

$$p(n) = P(X = n) = \frac{1}{2^n}$$

and its expectation the value of the series

$$E(X) = \sum_{n=1}^{\infty} \frac{n}{2^n}.$$

Using a little bit of analysis we can find the value of E(X), e.g., by considering the function  $f(x) := \sum_{n=1}^{\infty} nx^{n-1}$ , taking its indefinite integral, and noting that it is a geometric series sans the first term. Concretely,

$$\int f(x) \, dx = \sum_{n=1}^{\infty} x^n = -1 + \sum_{n=0}^{\infty} x^n,$$

which, for |x| < 1, converges to the value x/(1-x). Taking the derivative of this, we have  $1/(1-x)^2$ . Thus,

$$E(X) = \sum_{n=1}^{\infty} \frac{n}{2^n}$$

$$= \frac{1}{2} \sum_{n=1}^{\infty} \frac{n}{2^{n-1}}$$

$$= \frac{1/2}{(1 - (1/2))^2}$$

$$= 2.$$

This is the mean of X.

Next we must compute the mean of  $X^2$ . We have already computed the PMF of X hence,

$$E(X^2) = \sum_{n=1}^{\infty} \frac{n^2}{2^n}.$$

To find the limit of this series, we can use a similar method to the one in the last paragraph. That is, consider the function  $g(x) := \sum_{n=1}^{\infty} n^2 x^{n-1}$ . Taking its integral, we have

$$xG(x) = \int g(x) dx = \sum_{n=1}^{\infty} nx^n = x \sum_{n=1}^{\infty} nx^{n-1}$$

and repeat this on G, giving us

$$\int G(x) dx = \sum_{n=1}^{\infty} x^n = -1 + \sum_{n=0}^{n} x^n = \frac{x}{1-x}.$$

Tracing back our steps,

$$\int g(x) = \frac{x}{(1-x)^2}$$

so

$$g(x) = \frac{1 - x^2}{(1 - x)^4}.$$

Thus,

$$E(X) = \frac{1}{2} \sum_{n=1}^{\infty} \frac{n}{2^{n-1}}$$
$$= \frac{(1/2)(1 - (1/2)^2)}{(1 - (1/2))^4}$$
$$= 6.$$

Putting all of this together, the variance is

$$Var(X) = 6 - (2)^2 = 2.$$

For part (f), again, we let X be as above. The PMF of X is given by

$$p(n) = P(X = n) =$$

#### Problem 5.2 (Handout 7, # 8)

(Nonexistence of variance).

- (a) Show that for a suitable positive constant c, the function  $p(x) = c/x^3$ ,  $x = 1, \ldots$ , is a valid probability mass function (PMF).
- (b) Show that in this case, the expectation of the underlying random variable exists, but the variance does not!

Solution.

#### Problem 5.3 (Handout 7, # 9)

In a box, there are 2 black and 4 white balls. These are drawn out one by one at random (without replacement).

- (a) Let X be the draw at which the first black ball comes out. Find the mean the variance of X.
- (b) Let X be the draw at which the second black ball comes out. Find the meman\* the variance of X.

Solution. For part (a), we must first find the PMF of X. This we do explicitly,

$$p(1) = \frac{2}{6} = \frac{1}{3},$$

$$p(2) = \frac{2}{5} \cdot \frac{4}{6} = \frac{4}{15},$$

$$p(3) = \frac{2}{4} \cdot \frac{3}{5} = \frac{3}{10},$$

$$p(4) = \frac{2}{3} \cdot \frac{2}{4} = \frac{1}{3},$$

$$p(5) = \frac{1}{3}.$$

Thus,

$$E(X) = \frac{1}{3} + 2 \cdot \frac{4}{15} + 3 \cdot \frac{3}{10} + 4 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3}$$

$$= \frac{10 + 16 + 27 + 40 + 50}{30}$$

$$= \frac{143}{30}$$

$$\approx 4.767.$$

<sup>\*</sup>What is a meman? How do you pronounce meman? Is it mee-man or muh-man?

# Problem 5.4 (Handout 7, # 10)

Suppose X has a discrete uniform distribution on the set  $\{1, \ldots, N\}$ . Find formulas for the mean and the variance of X.

# Problem 5.5 (Handout 7, # 11)

 $(Be\ Original)$  Give an example of a random variable with mean 1 and variance 100.

## Problem 5.6 (Handout 7, # 13)

(Be Original). Suppose a random variable X has the property that its second and fourth moment are both 1.

What can you say about the nature of X?

## Problem 5.7 (Handout 7, # 14)

 $(Be\ Original).$  One of the following inequalities is true in general for all nonnegative random variables. Identify which one!

$$E(X)E(X^4) \ge E(X^2)E(X^3);$$
  
 $E(X)E(X^4) \le E(X^2)E(X^2).$ 

# Problem 5.8 (Handout 7, # 15)

Suppose X is the number of heads obtained in 4 tosses of a fair coin. Find the expected value of the weird function

$$\log(2+\sin(\frac{\pi}{4}x)).$$

## Problem 5.9 (Handout 7, # 16)

In a sequence of Bernoulli trials let X be the length of the run (of either successes or failures) started by the first trial.

(a) Find the distribution of X, E(X),  $\mathrm{Var}(X)$ .

### Problem 5.10 (Handout 7, # 17)

A man with n keys wants to open his door and tries the keys independently and at random. Find the mean and variance of the number of trials

- (a) if unsuccessful keys are not eliminated from further selections;
- (b) if they are.

(Assume that only one key fits the door. The exact distributions are given in II, 7, but are not required for the present problem.)
