CARLOS SALINAS PROBLEM 8.1

Problem 8.1

Show that the function

$$u(x,t) := \sum_{k=-\infty}^{\infty} (-1)^k \Phi(x-2k,t)$$

where

$$\Phi(x,t) = \frac{e^{-\frac{x^2}{4t}}}{\sqrt{4\pi t}}$$

is positive for |x| < 1, t > 0.

(*Hint*: Show that u satisfies $u_t = u_{xx}$ for t > 0,

$$\begin{cases} u = 0 & \text{on } \{ |x| = 1 \} \times \{ t \ge 0 \}, \\ u = \delta_0 & \text{on } \{ |x| = 1 \} \times \{ t = 0 \}. \end{cases}$$

Then, carefully apply the maximum/minimum principle in a domain $\{|x| \le 1\} \times \{\varepsilon \le t \le T\}$ for small $\varepsilon > 0$ and large T > 0 pass to the limit as $\varepsilon \to 0^+$ and $T \to \infty$.)

Solution. Taking the hint, let us verify that $u_t = u_{xx}$, for t > 0. By direct computation, we have

$$\Phi_{x}(x,t) = \frac{\partial}{\partial x} \left(\frac{e^{-\frac{x^{2}}{4t}}}{\sqrt{4\pi t}} \right) \qquad \Phi_{xx}(x,t) = \frac{\partial}{\partial x} \left(-\frac{xe^{-\frac{x^{2}}{4t}}}{2\sqrt{4\pi}t^{\frac{3}{2}}} \right) \\
= -\frac{xe^{-\frac{x^{2}}{4t}}}{2\sqrt{4\pi}t^{\frac{3}{2}}}, \qquad \qquad = \frac{x^{2}e^{-\frac{x^{2}}{4t}}}{4\sqrt{4\pi}t^{\frac{5}{2}}} - \frac{e^{-\frac{x^{2}}{4t}}}{2\sqrt{4\pi}t^{\frac{3}{2}}} \\
= \frac{(x^{2} - 2t)e^{-\frac{x^{2}}{4t}}}{4\sqrt{4\pi}t^{\frac{5}{2}}},$$

and

$$\Phi_t(x,t) = \frac{\partial}{\partial t} \left(\frac{e^{-\frac{x^2}{4t}}}{\sqrt{4\pi t}} \right)$$

$$= \frac{x^2 e^{-\frac{x^2}{4t}}}{4\sqrt{4\pi t^{\frac{5}{2}}}} - \frac{e^{-\frac{x^2}{4t}}}{2\sqrt{4\pi t^{\frac{3}{2}}}}$$

$$= \frac{(x^2 - 2t)e^{-\frac{x^2}{4t}}}{4\sqrt{4\pi t^{\frac{5}{2}}}}.$$

Since $\Phi_t = \Phi_{xx}$ it follows that $u_t = u_{xx}$ (for t > 0).

Next we show that u = 0 on $\{|x| = 1\} \times \{t \ge 0\}$ and $u = \delta_0$ on $\{|x| = 1\} \times \{t = 0\}$. To show u = 0 fix a $t \ge 0$ and after relabeling, we may assume that x = 1 which gives us

$$u(1,t) = \sum_{k=-\infty}^{\infty} (-1)^k \frac{e^{-\frac{k^2}{4t}}}{\sqrt{4\pi t}}$$

MA 523: Homework 8

PROBLEM 8.2 (TIKHONOV'S EXAMPLE)

Let

$$g(t) := \begin{cases} e^{-t^2} & t > 0, \\ 0 & t \le 0. \end{cases}$$

Then $g \in C^{\infty}(\mathbb{R})$ and we define

$$u(x,t) := \sum_{k=0}^{\infty} \frac{g^{(k)}(t)}{(2k)!} x^{2k}.$$

Assuming that the series is convergent, show that u(x,t) solves the heat equation in $\mathbb{R} \times (0,\infty)$ with the initial condition $u(x,0)=0, x\in\mathbb{R}$. Why doesn't this contradict the uniqueness theorem for the initial value problem.)

SOLUTION.

CARLOS SALINAS PROBLEM 8.3

Problem 8.3

Evaluate the integral

$$\int_{-\infty}^{\infty} \cos(ax) e^{-x^2} dx, \qquad (a > 0).$$

 $(\mathit{Hint}:$ Use the separation of variables to find the solution of the corresponding initial-value problem for the heat equation.)

Solution.
