Consider the infinitely many independent, identical experiments of throwing a pair of dice and the outcome of each experiment is the sum of the two numbers. Let  $N \geq 1$  be the number of experiments such that the number 5 or 7 first appears as the outcome. Let further X be that number at the N-th experiment, i.e. X can be either a 5 or 7.

- a) Find P(N=n) for n > 1.

b) Find P(X = 5).
c) Prove or disprove that N and X are independent.

(a)  $P(5) = P(II, 4), (3, 3), (3, 2), (4, 1) = \frac{4}{3h} = P(3, 7, 50 # 35)$ 

 $P(N=n) = P(\frac{n-1}{n05, n07})$ 

 $= (1-p-p_{7})^{n-1}(p_{5}+p_{7}) = \frac{66}{36}(\frac{10}{36})$ 

(b)  $P(X=5) = \sum_{n=1}^{\infty} P(N=n, X=5)$

$$=\sum_{n=1}^{\infty} (1-p_{s}-p_{r})^{n-1}p_{s} = \sum_{n=1}^{\infty} (1-p_{s}-p_{r})^{n-1}p_{s}$$

$$= p_{s} - \frac{1}{1-(1-p_{s}-p_{r})} = \frac{p_{r}}{p_{r}+p_{r}}$$

(c) 
$$P(N=1)P(X=1) = (1-p_5-p_4)^{n-1}(p_5+p_4) \times \frac{p_5}{p_5+p_4}$$
  
 $= (1-p_5-p_4)^{n-1}p_5$   
 $P(N=n, X=t) = P(+\frac{n-1}{n05, no.7}$ 

Hence NYX are independent.

Consider a city in which the male and female drivers occupy  $\alpha$  and  $1-\alpha$  fractions of the whole city driver population. In any given year, a male and female driver will have an accident with probability  $p_M$  and  $p_F$ . Assume that the behavior of each driver is independent from year to year.

Now a driver is randomly chosen. Let  $A_i$  be the event that this driver will have an accident in the *i*-th year. Let M be the event that the randomly chosen driver is a male.

- a) Suppose  $p_M > p_F$ . Show that  $P(M|A_1) > p(M)$ .

The pdf p(x) of the Gamma distribution with parameter  $(\alpha > 0, \lambda > 0)$  is given by:

$$p(x) = \begin{cases} \frac{\lambda e^{-\lambda x} (\lambda x)^{\alpha - 1}}{\Gamma(\alpha)}, & x \ge 0, \\ 0 & x < 0. \end{cases}$$

Let X and Y be independent Gamma distributed random variables with parameters  $(\alpha, \lambda)$  and  $(\beta, \lambda)$ . Show analytically that X + Y has a Gamma distribution with parameter  $(\alpha + \beta, \lambda)$ .

Show how as a by-product that the above conclusion leads to the following integration identity for  $\alpha, \beta > 0$ :

$$\int_0^1 x^{\alpha - 1} (1 - x)^{\beta - 1} dx = \frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha + \beta)}.$$
