Problem 10.1 (Munkres §52, Ex. 2)

Let α be a path in X from x_0 to x_1 ; let β be a path in X from x_1 to x_2 . Show that if $\gamma = \alpha * \beta$, then $\hat{\gamma} = \hat{\beta} \circ \hat{\alpha}$.

Proof. By Theorem 52.1, the paths α and β induce a group homomorphism $\hat{\alpha} \colon \pi_1(X, x_0) \to \pi_1(X, x_1)$ and $\hat{\beta} \colon \pi_1(X, x_1) \to \pi_1(X, x_2)$, respectively. We want to show therefore that the induced homomorphism $\hat{\gamma} = \widehat{\alpha} * \widehat{\beta}$ is in fact equivalent to the composition $\hat{\beta} \circ \hat{\alpha}$. Let [f] be a loop based at x_0 then

$$\widehat{\gamma}([f]) = \widehat{\alpha * \beta}([f])$$

$$= \left[\overline{\alpha * \beta}\right] * [f] * [\alpha * \beta]$$

$$= \left[\overline{\beta} * \overline{\alpha}\right] * [f] * [\alpha] * [\beta]$$

by the well-definedness of the path product operation, we have

$$= [\bar{\beta}] * [\bar{\alpha}] * [f] * [\alpha] * [\beta]$$

by associativity of the path product,

$$\begin{split} &= [\bar{\beta}] * ([\bar{\alpha}] * [f] * [\alpha]) * [\beta] \\ &= [\bar{\beta}] * \hat{\alpha}([f]) * [\beta] \end{split}$$

where $\alpha([f])$ is a loop based at x_1 so

$$= \hat{\beta}(\hat{\alpha}([f]))$$

= $(\hat{\beta} \circ \hat{\alpha})([f]).$

Thus, the following diagram commutes

PROBLEM 10.2 (MUNKRES §52, Ex. 3)

Let x_0 and x_1 be points of the path-connected space X. Show that $\pi_1(X, x_0)$ is Abelian if and only if for every pair α and β of paths from x_0 to x_1 , we have $\hat{\alpha} = \hat{\beta}$.

Proof. \Longrightarrow Suppose that $\pi_1(X, x_0)$ is Abelian. Then for any class of loops about x_0 , say [f] and [g], the product [f] * [g] = [g] * [f]. Let α and β be paths from x_0 to x_1 . Then the induced map on fundamental groups $\hat{\alpha}$ and $\hat{\beta}$ yield isomorphism by Theorem 52.1 so that the map $\hat{\beta} \circ \hat{\alpha}$ is an automorphism of $\pi_1(X, x_0)$. Moreover, we have

$$\hat{\beta} \circ \hat{\alpha}([f]) = \hat{\beta}(\hat{\alpha}([f]))$$

$$= \hat{\beta}([\bar{\alpha}] * [f] * [\alpha])$$

$$= [\beta] * ([\bar{\alpha}] * [f] * [\alpha]) * [\bar{\beta}]$$

by associativity of the path product, we may rewrite the above expression as

$$= ([\beta] * [\bar{\alpha}]) * [f] * ([\alpha] * [\bar{\beta}])$$

noting that $[\beta] * [\bar{\alpha}]$ and $[\alpha] * [\bar{\beta}]$ are loops based at x_0 , since $\pi_1(X, x_0)$ is Abelian, we have

$$= ([\beta] * [\bar{\alpha}]) * ([\alpha] * [\bar{\beta}]) * [f]$$

= $[e_{x_0}] * [f]$
= $[f]$.

Thus, $\hat{\beta} \circ \hat{\alpha} = \mathrm{id}_{\pi_1(X,x_0)}$, i.e., $\hat{\alpha} = \hat{\beta}$.

 \Leftarrow Let f and g be loops about x_0 . Then, since X is path connected, we claim that f and g are homotopic to the path product $\alpha_1 * \bar{\beta}_1$ and $\alpha_2 * \bar{\beta}_2$ where α_i, β_i are paths from x_0 to x_1 . More precisely, split f into the paths $f_1 = f(t/2)$ and $f_2 = f((t+1)/2)$; it is clear that $f = f_1 * f_2$. Let $x_2 := f_1(1)$ then there exists a path α from x_2 to x_1 since X is path connected. Now we claim that the following

$$H(x,t) := f_1(x) * \alpha(tx) * \bar{\alpha}((1-t)x) * f_2(x)$$

is a homotopy from $f = f_1 * f_2$ to the extended loop $\tilde{f} = f_1 * \alpha * \bar{\alpha} * f_2$.

Proof of claim. It is clear that H is continuous since it is a path products and multiplication on the unit interval I is continuous so tx is continuous. Lastly, $H(x,0) = f_1(x) * \alpha(0) * \bar{\alpha}(0) * f_2(x)$ and $H(x,1) = f_1(x) * \alpha(x) * \bar{\alpha}(x) * f_2(x)$.

Now, let $f \simeq_p \alpha_1 * \bar{\beta}_1$ and $g \simeq_p \alpha_2 * \bar{\beta}_2$ where α_i, β_i are paths from x_0 to x_1 . Then we have

$$\begin{split} [f] * [g] * [\bar{f}] * [\bar{g}] &= [\alpha_1 * \bar{\beta}_1] * [\alpha_2 * \bar{\beta}_2] * [\overline{\alpha_1 * \bar{\beta}_1}] * [\overline{\alpha_2 * \bar{\beta}_2}] \\ &= [\alpha_1 * \bar{\beta}_1] * [\alpha_2 * \bar{\beta}_2] * [\beta_1 * \bar{\alpha}_1] * [\beta_2 * \bar{\alpha}_2] \\ &= [\alpha_1] * [\bar{\beta}_1] * [\alpha_2] * [\bar{\beta}_2] * [\beta_1] * [\bar{\alpha}_1] * [\beta_2] * [\bar{\alpha}_2] \\ &= \hat{\bar{\alpha}}_1 ([\bar{\beta}_1] * [\alpha_2] * [\bar{\beta}_2] * [\beta_1]) * [\beta_2] * [\alpha_2] \\ &= \hat{\bar{\alpha}}_1 (\hat{\beta}_2 ([\alpha_2] * [\bar{\beta}_2])) * [\beta_2] * [\bar{\alpha}_2] \\ &= [\alpha_2] * [\bar{\beta}_2] * [\bar{\alpha}_2] \end{split}$$

3

$$= [\alpha_2] * [e_{x_0}] * [\bar{\alpha}_2]$$

= $[\alpha_2] * [\bar{\alpha}_2]$
= $[e_{x_0}]$.

Thus, $\pi_1(X, x_0)$ is Abelian.

4

PROBLEM 10.3 (MUNKRES §52, Ex. 4)

Let $A \subset X$; suppose $r: X \to A$ is continuous map such that r(a) = a for each $a \in A$. (The map r is called a *retraction* of X onto A.) If $a_0 \in A$, show that

$$r_* \colon \pi_1(X, x_0) \longrightarrow \pi_1(A, a_0)$$

is surjective.

Proof.

PROBLEM 10.4 (MUNKRES §53, Ex. 6)

Show that if X is path connected, the homomorphism induced by a continuous map is independent of the base point, up to isomorphisms of the groups involved. More precisely, let $h: X \to Y$ be continuous, with $h(x_0) = y_0$ and $h(x_1) = y_1$. Let α be a path in X from x_0 to x_1 , and let $\beta = h \circ \alpha$. Show that

$$\hat{\beta} \circ (h_{x_0})_* = (h_{x_1}) \circ \hat{\alpha}.$$

This equation expresses the fact that the following diagram of maps "commutes"

$$\pi_1(X, x_0) \xrightarrow{(h_{x_0})_*} \pi_1(Y, y_0)$$

$$\hat{\alpha} \downarrow \qquad \qquad \downarrow \hat{\beta}$$

$$\pi_1(X, x_1) \xrightarrow{(h_{x_1})_*} \pi_1(Y, y_1).$$

Proof.

PROBLEM 10.5 (MUNKRES §55, Ex. 1)

Show that if A is a retract of B^2 , then every continuous map $f \colon A \to A$ has a fixed point.

Proof.

PROBLEM 10.6 (MUNKRES §55, Ex. 2)

Show that if $h \colon S^1 \to S^1$ is nulhomotopic, then h has a fixed point and h maps some point x to its antipode -x.

Proof.

 $CARLOS \ SALINAS \qquad \qquad PROBLEM \ 10.7((A))$

PROBLEM 10.7 ((A))

Prove that every m-manifold is locally path-connected.

Proof.

 $CARLOS\ SALINAS$ $PROBLEM\ 10.8((B))$

PROBLEM 10.8 ((B))

Prove that every m-manifold is regular.

Proof.

 $CARLOS\ SALINAS$ PROBLEM 10.9((C))

PROBLEM 10.9 ((C))

Prove that there is no 1-1 continuous function $\iota \colon S^1 \to \mathbf{R}$. You may assume any fact about trigonometric functions. (Note: this shows in particular that there is no $\iota \colon S^1 \to \mathbf{R}$ with $p \circ \iota$ equal to the identity map, where p is the map in the note on the Fundamental Group of the Circle.)

Proof.

PROBLEM 10.10 ((D))

Prove Proposition C from the note on the Fundamental Group of the Circle.

Proof.
