**Problem 1.1.** Let  $(G, \cdot)$  be a group. Show that G is Abelian whenever Aut(G) is a cyclic group under composition.

*Proof.* Suppose that  $\operatorname{Aut}(G)$  is cyclic. Then  $\operatorname{Inn}(G) < \operatorname{Aut}(G)$  is cyclic. But  $\operatorname{Inn}(G) \cong G/Z(G)$ . Thus, G is Abelian by the following lemma.

**Lemma 1.** Let  $(G,\cdot)$  be a group. If G/Z(G) is cyclic, then G is Abelian.

Proof of lemma. Suppose that G/Z(G) is cyclic. Then  $G/Z(G) = \langle \bar{x} \rangle$  for some representative  $x \in G$ . This means that for any  $g \in G$ , we can write  $g = x^k z$  for some positive integer k, for some  $z \in Z(G)$ . Let  $g_1, g_2 \in G$ . Then, by the following obvious algebraic manipulations

$$g_1g_2=x^{k_1}z_1x^{k_2}z_2=z_1x^{k_1+k_2}z_2=z_2x^{k_2+k_1}z_1=z_2x^{k_2}x^{k_1}z_1=(x^{k_2}z_2)(x^{k_1}z_1)=g_2g_1,$$

we see that G is Abelian.

**Problem 1.2.** Let  $(G, \cdot)$  be an Abelian group. The torsion subgroup of G is defined as the collection of elements of finite order:

$$Tor(G) := \{ g \in G \mid g^m = e \text{ for some integer } m > 0 \}.$$

- (a) Show that the quotient group G/Tor(G) is torsion free, i.e., it contains no nontrivial elements of finite order.
- (b) Show that Tor(G) is finite whenever G is finitely generated. (Do not assume that G is finite.)

Proof. (a) (Presumably the torsion subgroup is a normal subgroup of G.) Define  $T := \operatorname{Tor}(G/\operatorname{Tor}(G))$ . We will show that  $T = \bar{e}$ . It is clear that  $\langle \bar{e} \rangle \subset T$  thus, we need only show that  $T \subset \langle \bar{e} \rangle$ , i.e., if  $t \in T$  then  $g = \bar{e}$ . Let  $\bar{g} \in T$ . Then  $\bar{g} \in G/\operatorname{Tor}(G)$  and  $\bar{g}^m = \bar{e}$  for some positive integer m. But  $\bar{g}^m = \bar{e}$  implies that  $g^m \operatorname{Tor}(G) = \operatorname{Tor}(G)$ , i.e.,  $g^m \in \operatorname{Tor}(G)$ . Thus,  $(g^m)^n = g^{mn}e$  for some positive integer n. Thus,  $g \in \operatorname{Tor}(G)$  so we must have  $\bar{g} = \bar{e}$ .

(b) Suppose that G is finitely generated. By the fundamental theorem of finitely generated Abelian groups,  $G \cong \mathbf{Z}^r \times Z_{s_1} \times \cdots \times Z_{s_n}$  for positive integers  $r, s_1, ..., s_n$ . It suffices to show that  $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n} = \mathrm{Tor}(G)$  (once we have demonstrated this, note that  $|\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}| = s_1 \cdots s_n < \infty$ ). It is clear that  $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n} \subset \mathrm{Tor}(G)$  since every element of  $\mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}$  has finite order, i.e., for any  $(\mathbf{1}, z_1, ..., z_n) \in \mathbf{1} \times Z_{s_1} \times \cdots \times Z_{s_n}$ , we have  $z = (\mathbf{1}, z_1, ..., z_n)^{s_1 \cdots s_n} = (\mathbf{1}, 1, ..., 1)$  (as a consequence of Lagrange's theorem). Now, suppose  $z := (\mathbf{z}, z_1, ..., z_n) \in \mathrm{Tor}(G)$ . Then  $z^m = (\mathbf{1}, 1, ..., 1)$  for some positive integer m. Since every non-identity element of  $\mathbf{Z}^r$  has infinite order,  $\mathbf{z} = \mathbf{1}$  and  $s_i \mid k$  for all i. Thus  $z \in \mathbf{1} \times Z_{s_1} \times \cdots Z_{s_n}$ . Thus,  $|\mathrm{Tor}(G)| = s_1 \cdots s_n$  so  $\mathrm{Tor}(G)$  is indeed finite.

**Problem 1.3.** Let  $(G,\cdot)$  be a group of order |G|=351. Show that G is solvable.

Proof. The best plan of attack is to use Sylow's theorem. First, let us factor the order of G into powers of primes,  $|G| = 351 = 3^3 \cdot 13$ . In light of this factorization, it suffices to show that either  $|\operatorname{Syl}_{13}(G)| = 1$  or  $|\operatorname{Syl}_3(G)| = 1$  and hence, the unique Sylow-13 (or Sylow-3) subgroup will be a normal subgroup of G. By Sylow's theorem,  $n_{13} \equiv 1 \pmod{13}$  and  $n_{13} \mid 3^3$ . Thus,  $n_{13} = 1$  or 27. Suppose  $n_{13} = 27$ . Then G contains  $12 \times 27 = 324$  elements of order 13 so there are 351 - 324 - 1 = 26 elements remaining. This implies that  $n_3 = 1$ . Thus,  $P_3 \in \operatorname{Syl}_3(G)$  is the unique Sylow-3 subgroup of G hence, is normal. Thus,  $G \triangleright P_3$  so  $G/P_3$  is a group. Incidentally,  $G/P_3 \cong Z_{13}$  hence, solvable and  $P_3$  is a p-group, hence solvable. Thus, G is solvable.

On the other hand, if  $n_{13} = 1$  then  $P_{13} \in \text{Syl}_{13}(G)$  is the unique Sylow-13 subgroup of G hence, normal in G. Since  $P_{13}$  is a p-group, it is solvable. Moreover,  $G/P_{13}$  is a group of order  $3^3$ , i.e., a p-group, hence, solvable. Thus, G is solvable.

In either case, we have shown that G must be solvable.

**Problem 1.4.** Let  $(G, \cdot)$  be a group, and H < G a subgroup of finite index. Show that there exists a normal subgroup  $N \lhd G$  contained in H which is also of finite index. (Do not assume that G is finite.)

Proof. Suppose H < G is a subgroup of finite index, i.e., H partitions G into a finite number of cosets, say  $G/H \coloneqq \{H, g_1H, ..., g_{k-1}H\}$ . Define a homomorphism  $\varphi \colon G \to S_{G/H}$  by  $g \mapsto gH$  (this is clearly a homomorphism: take  $g_1, g_2 \in G$  then  $\varphi(g_1g_2) = g_1g_2H = (g_1H)(g_2H) = \varphi(g_1)\varphi(g_2)$ ). Thus,  $\ker \varphi \lhd G$  of finite index (in particular, by the 1st isomorphism theorem and Lagrange's theorem  $|G \colon \ker \varphi| \mid |S_{G/H}| = |S_k| = k!$ ). Thus, it suffices to show that  $\ker \varphi \lhd H$ . But this is clear since, if  $g \in \ker \varphi$  then gH = H hence,  $g \in H$ .

**Problem 1.5.** Let  $(G, \cdot)$  be a finite group, and  $\varphi \colon G \to G$  be a group homomorphism. Show that for all normal Sylow p-subgroups  $P \triangleleft G$  we have  $\varphi(P) < P$ .

*Proof.* Suppose  $|G| < \infty$  and let  $P \in \operatorname{Syl}_p(G)$  be normal in G. Then P is unique of order  $p^{\alpha}$  for some  $\alpha$ . By the 1st isomorphism theorem,  $\varphi(P) \mid p^{\alpha}$  so  $\varphi(P)$  must be contained in a Sylow p-subgroup of G. Since P is the unique Sylow p-subgroup of G,  $\varphi(P) < P$ .

**Problem 1.6.** Let  $(R, +, \cdot)$  be a commutative ring with  $1 \neq 0$ .

- (a) Show that R is an integral domain if and only if (0) is a prime ideal.
- (b) Show that R is a field if and only if (0) is a maximal ideal.

*Proof.* (a)  $\Leftarrow$  Suppose that (0) is a prime ideal. Then R/(0) is a domain. But  $R/(0) \cong R$  (canonically i.e., the map  $\bar{r} \mapsto r$  is a bijective homomorphism) hence, R is a domain.

 $\leftarrow$  Conversely, suppose that R is a domain.

**Problem 1.7.** let  $(R, +, \cdot)$  be a unique factorization domain. Choose an irreducible element  $p \in R$ , and define the *localization at* p as the ring of fractions  $R_p = D^{-1}R$  with respect to the multiplicative set D = R - (p). Show that  $R_p$  is a principal ideal domain.

**Problem 1.8.** Let  $(F, +, \cdot)$  be a field, and  $F(\theta)/F$  be a finite, separable extension. Let L be the splitting field of the minimal polynomial  $m_{\theta,F}(x) \in F[x]$ . Prove that for every prime p dividing the degree [L:F], there exists a field K such that  $F \subset K \subset L$ , [L:K] = p, and  $L = K(\theta)$ .

Proof.

**Problem 1.9.** Let  $(\mathbf{F}_p, +, \cdot)$  be a finite field whose Cardinality p is prime. Fix a positive integer n which is not divisible by p, and let  $\zeta_n$  be a primitive nth root of unity. Show that  $[\mathbf{F}_p(\zeta_n) : \mathbf{F}_p] = \alpha$  is the least positive integer such that  $p^{\alpha} \equiv 1 \pmod{n}$ .

Proof.

**Problem 1.10.** Prove that the Galois group of the splitting field over  $\mathbf{Q}$  of  $f(x) = x^4 + 4x^2 + 2$  is a cyclic group.

#### 2 Spring 2008

**Problem 2.1.** Let  $(G, \cdot)$  be a group, (H, +) be an Abelian group, and  $\varphi \colon G \to H$  be a group homomorphism. If N is a subgroup such that  $\ker \varphi < N < G$ , show that  $N \lhd G$  is a normal subgroup.

*Proof.* Let N be a subgroup of G containing  $\ker \varphi$ . Then we must show that for any  $g \in G$ ,  $gNg^{-1} \subset N$ . First we observe that, since  $\ker \varphi \lhd G$ , then  $\ker \varphi \lhd N$  since for any  $g \in N$ , g is also in G so that  $g(\ker \varphi)g^{-1} = \ker \varphi \subset N$ . Thus,  $\ker \varphi \lhd N$ . By the first isomorphism theorem<sup>1</sup>,  $G/\ker \varphi \cong H$  hence,  $G/\ker \varphi$  is Abelian. Moreover,  $N/\ker \varphi \lhd G/\ker \varphi$  hence,  $N/\ker \varphi \lhd G/\ker \varphi$ . It follows immediately from the lattice isomorphism theorem<sup>2</sup> (this is essentially the UMP of the quotient by a group) that  $N \lhd G$ .

**Problem 2.2.** Let  $(G,\cdot)$  be a finite Abelian group of even order, i.e., |G|=2k for some  $k\in \mathbb{N}$ .

- (a) For k odd, show that G has exactly one element of order 2.
- (b) Does the same happen for k even? Prove or give a counterexample.

Proof. (a) This problem is most easily proven using Cauchy's theorem<sup>3</sup>. Suppose that k is odd. If  $k=1,\ G\cong Z_2$  and we are done  $(Z_2$  contains only one nontrivial element and its order is 2). Otherwise k>2. Then by Cauchy's theorem we are guaranteed that there exists an element  $g\in G$  of order 2. Suppose h is another element (distinct from g) of order 2. Since 2 is the smallest prime number dividing the order of G, by a corollary to Cayley's theorem<sup>4</sup>,  $\langle g \rangle$  is a normal subgroup of G so  $G/\langle g \rangle$  is a group. Moreover, since  $h \neq g$ , then  $\bar{h} \neq \bar{e}$  and  $1 \geq |\bar{h}| > 1$  implies that  $|\bar{h}| = 1$ . But  $1 \leq |\bar{h}| < 1$  contradicting Lagrange's theorem. It follows that  $1 \leq 1 \leq 1$  must have exactly one element of order 2.

(b) No. Here is the simplest counterexample: Consider the direct product  $Z_2 \times Z_2$ . The elements (1,0) and (0,1) are elements of order 2, but are not equivalent.

**Problem 2.3.** Let  $(G, \cdot)$  be a finite group of odd order, and  $H \triangleleft G$  be a normal subgroup of prime order |H| = 17. Show that H < Z(G).

*Proof.* Let G act on H by conjugation, i.e., the map  $\varphi \colon G \times H \to H$  defined by the rule  $\varphi(g,h) \coloneqq ghg^{-1}$  determines a group action on H. First, we verify that  $\varphi$  indeed defines a group action on H: First, observe that for  $e_G \in G$  the identity element,  $\varphi(e_G, h) = e_G h e_G^{-1} = h$ ; next, if  $g_1, g_2 \in G$  then

$$\varphi(g_1, \varphi(g_2, h)) = \varphi(g_1, g_2 h g^{-1}) = g_1 g_2 h g_2^{-1} g_1 = g_1 g_2 h (g_1 g_2)^{-1} = \varphi(g_1 g_2, h).$$

Lastly,  $\varphi$  is clearly well-defined in the sense  $\varphi(g,h) \in H$  for all  $g \in G$ ,  $h \in H$ . Thus,  $\varphi$  is a group action. Now, let us ask what the kernel of this action is. Thus group action  $\varphi$ , induces a group homomorphism  $\varphi' \colon G \to \operatorname{Aut}(H)$  given by  $\varphi'(g) \coloneqq \operatorname{Eval}(\varphi,g)$ . Now, since |H| = 17,  $H \cong Z_{17}$ , hence is cyclic. Thus,  $\operatorname{Aut}(H) \cong (\mathbf{Z}/17\mathbf{Z})^{\times} \cong Z_{16}$ . Now, since  $|\varphi'(G)| \mid |G|, |\varphi'(G)|$  is odd. But  $\varphi'(G) < \operatorname{Aut}(H)$  so, by Lagrange's theorem,  $|\varphi'(G)| \mid 16$ . Thus,  $|\varphi'(G)| = 1$ , i.e.,  $\varphi'$  is the trivial homomorphism, i.e.,  $\varphi(g,h) = ghg^{-1} = h = \varphi(1,h)$ . Thus, H < Z(G).

<sup>&</sup>lt;sup>1</sup>Theorem 16 of Dummit and Foote §3, p. 99.

<sup>&</sup>lt;sup>2</sup>Theorem 20 of Dummit and Foote §3, p. 99.

<sup>&</sup>lt;sup>3</sup>Theorem 11 of Dummit and Foote §3, p. 93

<sup>&</sup>lt;sup>4</sup>Corollary 5 of Dummit and Foote §4, p. 121

**Problem 2.4.** Let  $(G, \cdot)$  be a finite group. Show that there exists a positive integer n such that G is isomorphic to a subgroup of  $A_n$ , the alternating group on n letters. [Hint: Show that  $A_n$  contains a copy of  $S_{n-1}$  when  $n \geq 3$ .]

*Proof.* Let n-2 := |G|. If n-2 = 1 or 2,  $G \cong 0$  (the trivial group) or  $G \cong \mathbb{Z}_2$ , both of which are exactly  $A_1$  and  $A_2$ . Suppose  $n-2 \geq 3$ . By Cayley's theorem, G imbeds into  $S_{n-1}$ . Now, define a homomorphism

$$\varphi(\sigma) \coloneqq \begin{cases} \sigma & \text{if } \sigma \text{ is even} \\ \sigma(n+1 \ n+2) & \text{if } \sigma \text{ is odd} \end{cases}.$$

We check that this is in fact a homomorphism. Let  $\sigma, \tau \in G$ . Then

$$\varphi(\sigma\tau) = \begin{cases} \sigma\tau & \text{if } \sigma\tau \text{ is even} \\ \sigma\tau(n+1 \ n+2) & \text{if } \sigma\tau \text{ is odd} \end{cases}.$$

But  $\sigma\tau$  is odd if and only if  $\sigma$  or  $\tau$  is odd and  $\sigma\tau$  is even if and only if  $\tau$  is even.

**Problem 2.5.** Let  $(G,\cdot)$  be a group of order |G|=200.

- (a) Show that G is solvable.
- (b) Show that G is the semidirect product of two p-subgroups.

*Proof.* (a) First we factor the order of the group G,  $|G| = 200 = 2^3 \cdot 5^2$ . Now we will make use of Sylow's theorem to show that G has at least one normal p-subgroup.

**Problem 2.6.** Let  $(R, +, \cdot)$  and  $(S, +, \cdot)$  be commutative rings with  $1 \neq 0$ , and let  $\varphi \colon R \to S$  be a surjective ring homomorphism. Assuming that R is local, i.e., it has a unique maximal ideal, show that S is also local.

**Problem 2.7.** Let  $(R, +, \cdot)$  be a principal ideal domain.

- (a) Show that every maximal ideal in R is a prime ideal.
- (b) Must every prime ideal in R be a maximal ideal? Prove or give a counterexample.

**Problem 2.8.** Let L/F be a Galois extension of degree [L:F]=2p where p is an odd prime.

- (a) Show that there exists a unique quadratic subfield E, i.e.,  $F \subset E \subset L$  and [E:F]=2.
- (b) Does there exist a unique subfield K of index 2, i.e.,  $F \subset K \subset L$  and [L:K] = 2? Prove or give a counterexample.

**Problem 2.9.** Fix a prime p, and consider the Artin–Schreier polynomial  $f(x) = x^p - x - 1$ .

(a) Let  $\mathbf{F}_p(f)$  be the splitting field of f(x) over  $\mathbf{F}_p$ . Show that  $\operatorname{Gal}(\mathbf{F}_p(f)/\mathbf{F}_p) \cong \mathbb{Z}_p$ .

(b) Prove that f(x) is irreducible in Z[x].
Proof.
Problem 2.10. Determine the Galois group of the splitting field over Q of f(x) = x<sup>4</sup> + 4.

## 3 August, 2015

Problem 3.1.

### 3.1 August 2010
