# 1 Homework Solutions

## 1.1 Homework 1

PROBLEM 1.1 (Taylor's formula). Let  $f: \mathbb{R}^n \to \mathbb{R}$  be smooth,  $n \geq 2$ . Prove that

$$f(x) = \sum_{|\alpha| \le k} \frac{1}{\alpha!} D^{\alpha} f(0) x^{\alpha} + \mathcal{O}(|x|^{k+1})$$

as  $x \to \mathbf{0}$  for each k = 1, 2, ..., assuming that you know this formula for n = 1. Hint: Fix  $x \in \mathbb{R}^n$  and consider the function of one variable g(t) := f(tx). Prove that

$$\frac{d^m}{dt^m}g(t) = \sum_{|\alpha|=m} \frac{m!}{\alpha!} D^{\alpha} f(tx) x^{\alpha},$$

by induction on m.

SOLUTION. Taking the hint, apply Taylor's formula to g(t) = f(tx):

$$g(t) = \sum_{k=0}^{m}$$

PROBLEM 1.2. Write down the characteristic equation for the PDE

$$u_t + b \cdot Du = f \tag{*}$$

on  $\mathbb{R}^n \times (0, \infty)$ , where  $b \in \mathbb{R}^n$ . Using the characteristic equation, solve (\*) subject to the initial condition

$$u = g$$

on  $\mathbb{R}^n \times \{t=0\}$ . Make sure the answer agrees with formula (5) in §2.1.2 of [E].

SOLUTION.

PROBLEM 1.3. Solve using the characteristics:

- (a)  $x_1^2 u_{x_1} + x_2^2 u_{x_2} = u^2$ , u = 1 on the line  $x_2 = 2x_1$ .
- (b)  $uu_{x_1} + u_{x_2} = 1$ ,  $u(x_1, x_1) = x_1/2$ .
- (c)  $x_1u_{x_1} + 2x_2u_{x_2} + u_{x_3} = 3u$ ,  $u(x_1, x_2, 0) = g(x_1, x_2)$ .

PROBLEM 1.4. For the equation

$$u = x_1 u_{x_1} + x_2 u_{x_2} + \frac{1}{2} \left( u_{x_1}^2 + u_{x_2}^2 \right)$$

find a solution with  $u(x_1, 0) = (1 - x_1^2)/2$ .

#### 1.2 Homework 2

PROBLEM 1.5. Verify assertion (36) in [E, §3.2.3], that when  $\Gamma$  is not flat near  $x^0$  the noncharacteristic condition is

$$D_p F(p^0, z^0, x^0) \cdot \nu(x^0) \neq 0.$$

(Here  $\nu(x^0)$  denotes the normal to the hypersurface  $\Gamma$  at  $x^0$ ).

SOLUTION.

PROBLEM 1.6. Show that the solution of the quasilinear PDE

$$u_t + a(u)u_x = 0$$

with initial conditions u(x,0) = g(x) is given implicitly by

$$u = g(x - a(u)t).$$

Show that the solution develops a shock (becomes singular) for some t > 0, unless a(g(x)) is a nondecreasing function of x.

SOLUTION.

PROBLEM 1.7. Show that the function u(x,t) defined for  $t \geq 0$  by

$$u(x,t) = \begin{cases} -\frac{2}{3} \left( t + \sqrt{3x + t^2} \right) & \text{for } 4x + t^2 > 0\\ 0 & \text{for } 4x + t^2 < 0 \end{cases}$$

is an (unbounded) entropy solution of the conservation law  $u_t + (u^2/2)_x = 0$  (inviscid Burgers' equation).

#### 1.3 Homework 3

PROBLEM 1.8. Consider the initial value problem

$$\begin{cases} u_t = \sin u_x, \\ u(x,0) = \frac{\pi}{4}x. \end{cases}$$

Verify that the assumptions of the Cauchy–Kovalevskaya theorem are satisfied and obtain the taylor series of the solution about the origin.

SOLUTION.

PROBLEM 1.9. Consider the Cauchy problem for u(x,y)

$$\begin{cases} u_y = a(x, y, u)u_x + b(x, y, u), \\ u(x, 0) = 0, \end{cases}$$

let a and b be analytic functions of their arguments. Assume that  $D^{\alpha}a(0,0,0) \geq 0$  and  $D^{\alpha}b(0,0,0) \geq 0$  for all  $\alpha$ . (Remember by definition, if  $\alpha = 0$  then  $D^{\alpha}f = f$ .)

- (a) Show that  $D^{\beta}u(0,0) \geq 0$  for all  $|\beta| \leq 2$ .
- (b) Prove that  $D^{\beta}u(0,0) \geq 0$  for all  $\beta = (\beta_1, \beta_2)$ . (*Hint:* Argue as in the proof of the Cauchy–Kovalevskaya theorem; i.e., use induction in  $\beta_2$ )

SOLUTION.

PROBLEM 1.10. (Kovalevskaya's example) show that the line  $\{t=0\}$  is characteristic for the heat equation  $u_t = u_{xx}$ . Show there does not exist an analytic solution u of the heat equation in  $\mathbb{R} \times \mathbb{R}$ , with  $u = 1/(1+x^2)$  on  $\{t=0\}$ . (*Hint:* assume there is an analytic solution, compute its coefficients, and show instead that the resulting power series diverges in any neighborhood of (0,0).)

#### 1.4 Homework 4

PROBLEM 1.11 (Legendre transform). Let  $u(x_1, x_2)$  be a solution of the quasilinear equation

$$a^{11}(Du)u_{x_1x_1} + 2a^{12}(Du)u_{x_1x_2} + a^{22}(Du)u_{x_2x_2} = 0$$

in some region of  $\mathbb{R}^2$ , where we can invert the relations

$$p^1 = u_{x_1}(x_1, x_2), \quad p^2 = u_{x_2}(x_1, x_2)$$

to solve for

$$x^{1} = x^{1}(p_{1}, p_{2}), \quad x^{2} = x^{2}(p_{1}, p_{2}).$$

Define then

$$v(p) := \mathbf{x}(p) \cdot p - u(\mathbf{x}(p)),$$

where  $\mathbf{x} = (x^1, x^2), p = (p_1, p_2)$ . Show that v satisfies the *linear* equation

$$a^{22}(p)v_{p_1p_2} - 2a^{12}(p)v_{p_1p_2} + a^{11}(p)v_{p_1p_2} = 0.$$

(Hint: See [Evans, 4.4.3b], prove the identities (29)).

SOLUTION.

PROBLEM 1.12. Find the solution u(x,t) of the one-dimensional wave equation

$$u_{tt} - u_{xx} = 0$$

in the quadrant x > 0, t > 0 for which

$$\begin{cases} u(x,0) = f(x), & u_t(x,0) = g(x), & \text{for } x > 0, \\ u_t(0,t) = \alpha u_x(0,t), & \text{for } t > 0, \end{cases}$$

where  $\alpha \neq -1$  is a given constant. Show that generally no solution exists when  $\alpha = -1$ . (*Hint:* Use a representation u(x,t) = F(x-t) + G(x+t) for the solution.)

SOLUTION.

PROBLEM 1.13. (a) Let u be a solution of the wave equation  $u_{tt} - c^2 u_{xx} = 0$  for  $0 < x < \pi$ , t > 0 such that  $u(0,t) = u(\pi,t) = 0$ . Show that the energy

$$E(t) = \frac{1}{2} \int_0^{\pi} (u_t^2 + c^2 u_x^2) dx, \quad t > 0$$

is independent of t; i.e.,  $\frac{d}{dt}E=0$  for t>0. Assume that u is  $C^2$  up to the boundary.

(b) Express the energy E of the Fourier series solution

$$u(x,t) = \sum_{n=1}^{\infty} (a_n \cos(nct) + b_n \sin(nct)) \sin(nx)$$

in terms of coefficients  $a_n$ ,  $b_n$ .

#### 1.5 Homework 5

PROBLEM 1.14. Prove that Laplace's equation  $\Delta u = 0$  is rotation invariant; that is, if O is an orthogonal  $n \times n$  matrix and we define  $v(x) := u(Ox), x \in \mathbb{R}^n$ , then  $\Delta v = 0$ .

SOLUTION.

PROBLEM 1.15. Let n=2 and U be the halfplane  $\{x_2>0\}$ . Prove that

$$\sup_{U} u = \sup_{\partial U} u$$

for  $u \in C^2(U) \cap C(\bar{U})$  which are harmonic in U under the additional assumption that u is bounded from above in  $\bar{U}$ . (The additional assumption is needed to exclude examples like  $u = x_2$ .) [Hint: Take for  $\varepsilon > 0$  the harmonic function

$$u(x_1, x_2) - \varepsilon \ln \sqrt{x_1^2 + (x_2 + 1)^2}.$$

Apply the maximum principle to a region  $\{x_1^2 + (x_2 + 1)^2 < a^2, x_2 > 0\}$  with large a. Let  $\varepsilon \to 0$ .

SOLUTION.

PROBLEM 1.16. Let  $U \subset \mathbb{R}^n$  be an open set. We say  $v \in C^2(U)$  is subharmonic if

$$-\Delta v \le 0$$
 in  $U$ .

(a) Let  $\varphi \colon \mathbb{R}^m \to \mathbb{R}$  be smooth and convex. Assume  $u^1, \dots, u^m$  are harmonic in U and

$$v := \varphi(u_1, \dots, u_m).$$

Prove v is subharmonic.

[Hint: Convexity for a smooth function  $\varphi(z)$  is equivalent to  $\sum_{j,k=1}^{m} \varphi_{z_j,z_k}(z)\xi_j\xi_k \geq 0$  for any  $\xi \in \mathbb{R}^m$ .]

(b) Prove  $v := |Du|^2$  is subharmonic, whenever u is harmonic. (Assume that harmonic functions are  $C^{\infty}$ .)

Solution.

#### 1.6 Homework 6

PROBLEM 1.17. For n=2 find Green's function for the quadrant  $\{x_1>0,x_2>0\}$  by repeated reflection.

SOLUTION.

PROBLEM 1.18. (Precise form of Harnack's inequality) Use Poisson's formula for the ball to prove

$$\frac{r^{n-2}(r-|x|)}{(r+|x|)^{n-1}}u(0) \le u(x) \le \frac{r^{n-2}(r+|x|)}{(r-|x|)^{n-1}}u(0)$$

whenever u is positive and harmonic in  $B(0,r) = \{ x \in \mathbb{R}^n : |x| < r \}.$ 

SOLUTION.

PROBLEM 1.19. Let  $P_k(x)$  and  $P_m(x)$  be homogeneous harmonic polynomials in  $\mathbb{R}^n$  of degrees k and m respectively; i.e.,

$$P_k(\lambda x) = \lambda^k P_k(x),$$
  $P_m(\lambda x) = \lambda^m P_m(x)$  for every  $x \in \mathbb{R}^n$ ,  $\lambda > 0$ ,  
 $\Delta P_k = 0,$   $\Delta P_m = 0$  in  $\mathbb{R}^n$ .

(a) Show that

$$\frac{\partial P_k}{\partial \nu} = k P_k(x), \qquad \frac{\partial P_m}{\partial \nu} = m P_m(x) \qquad \text{on } \partial B(0,1)$$

where  $B(0,1) = \{ x \in \mathbb{R}^n : |x| < 1 \}$  and  $\nu$  is the outward normal on  $\partial B(0,1)$ .

(b) Use (a) and Green's formula to prove that

$$\int_{\partial B(0,1)} P_k(x) P_m(x) d\sigma = 0, \quad \text{if } k \neq m.$$

# 2 Exams

## 2.1 Midterm Practice Problems

PROBLEM 2.1. Solve  $u_{x_1}^2 + x_2 u_{x_2} = u$  with initial conditions  $u(x, 1) = x^2/4 + 1$ .

SOLUTION. Assuming  $u(x,1) = x^2/4 + 1$  was meant to be written  $u(x_1,1) = x_1^2/4 + 1$ , an obvious candidate for the solution is

$$\hat{u}(x_1, x_2) := \frac{x_1^2}{4} + x_2.$$

First, note that u does in fact solve the PDE,

$$\hat{u}_{x_1}^2 + x_2 \hat{u}_{x_2} = \left(\frac{x_1^2}{4} + x_2\right)_{x_1}^2 + x_2 \left(\frac{x_1^2}{4} + x_2\right)_{x_2}$$

$$= \left(\frac{x_1}{2}\right)^2 + x_2$$

$$= \frac{x_1^2}{4} + x_2$$

$$= \hat{u}.$$

It is clear that  $\hat{u}$  satisfies the conditions at  $x_2 = 1$ .

PROBLEM 2.2. Find the maximal  $t_0 > 0$  for which the (classical) solution of the Cauchy problem

$$\begin{cases} uu_x + u_t = 0, \\ u(x,0) = e^{-x^2/2}, \end{cases}$$

exists in  $\mathbb{R} \times [0, t)$ ; i.e., the first time  $t = t_0$  when the shock develops.

Solution. First, let us find a solution to the problem using the method of characteristics. Let

$$\begin{cases} \dot{x} = z, & \dot{t} = 1, \\ \dot{z} = 0, \end{cases}$$

then, fixing a point  $(x,t) \in \mathbb{R} \times (0,\infty)$  and starting at (0,0), we have

$$\begin{cases} x(s) = z_0 s, & t(s) = s, \\ z(s) = z_0. \end{cases}$$

Thus,

$$x = u_0$$

PROBLEM 2.3. If  $\rho_0$  denotes the maximum density of cars on a highway (i.e., under bumpet-to-bumper conditions), then a reasonable model for traffic density  $\rho$  is given by

$$\begin{cases} \rho_t + (F(\rho))_x = 0, \\ F(\rho) = cp\left(1 - \frac{\rho}{\rho_0}\right), \end{cases}$$

where c > 0 is a constant (free speed of highway). Suppose the initial density is

$$\rho(x,0) = \begin{cases} \frac{1}{2}\rho_0 & \text{if } x < 0, \\ \rho_0 & \text{if } x > 0. \end{cases}$$

Find the shock curve and describe the wak solution. (Interpret your result for the traffic flow.)

SOLUTION.

PROBLEM 2.4. Find the characteristics of the second order equation

$$u_{xx} - (2\cos x)u_{xy} - (3\sin^2 x)u_{yy} - yu_y = 0,$$

and transform it to the canonical form.

SOLUTION.

PROBLEM 2.5. Let  $Lu := u_{xx} - 4u_{yy} + \sin(y + 2x)u_x = 0$ .

- (a) Consider the level curve  $\Gamma = \{(x,y) : \varphi(x,y) = C\}$  where  $|D\varphi| \neq 0$  on  $\Gamma$ . Define what it means for  $\Gamma$  to be characteristic with respect to L at a point  $(x_0, y_0) \in \Gamma$ .
- (b) Find the points at which the curve  $x^2 + y^2 = 5$  is characteristic.
- (c) Is it true that every smooth simple closed curve  $\Gamma$  in  $\mathbb{R}^2$  has at least one point at which it is characteristic with respect to L?

SOLUTION.

PROBLEM 2.6. Consider the second order equation

$$Lu := u_{xx} - 2xu_{xy} + x^2u_{yy} - 2u_y = 0.$$

- (a) Find the characteristic curves of Lu = 0. What is the type of this equation?
- (b) Find the points on the line  $\Gamma := \{(x,y) \in \mathbb{R}^2 : x+y=1\}$  at which  $\Gamma$  is characteristic with respect to Lu = 0.

PROBLEM 2.7. Solve the initial boundary value problem for the equation  $u_{tt} = u_{xx}$  in  $\{x > 0, t > 0\}$  satisfying

$$\begin{cases} u(x,0) = \sin^2 x, & u_t(x,0) = \sin x, \\ u(0,t) = 0. \end{cases}$$

SOLUTION.

PROBLEM 2.8. Consider the initial/boundary value problem

$$\begin{cases} u_{tt} - u_{xx} = 0 & \text{for } 0 < x < \pi, \ t > 0, \\ u(x,0) = x, & u_t(x,0) = 0 & \text{for } 0 < x < \pi, \\ u_x(0,t) = 0, & u_x(\pi,t) = 0 & \text{for } t > 0. \end{cases}$$

- (a) Find a weak solution of the problem.
- (b) Is the solution unique? Continuous?  $C^1$ ?

SOLUTION.

PROBLEM 2.9. Let  $B_1^+$  denote the open half-ball  $\{x \in \mathbb{R}^n : |x| < 1, x_n > 0\}$ . Assume  $u \in C(\bar{B}_1^+)$  is harmonic in  $B_1^+$  with u = 0 on  $\partial B_1^+ \cap \{x_n = 0\}$ . Set

$$v(x) := \begin{cases} u(x) & \text{if } x_n \ge 0, \\ -u(x_1, \dots, x_{n-1}, -x_n) & \text{if } x_n < 0, \end{cases}$$

for  $x \in B_1$ . Prove v is harmonic in  $B_1$ .

Hint: It will be enough to prove that  $\int_B \nabla v \nabla \eta \, dx = 0$  for any test function  $\eta \in C_0^{\infty}(B_1)$ . Split  $\int_{B_1} = \int_{B_1^+} + \int_{B_1^-}$  and apply the integration by parts formula to each of  $\int_{B_1^{\pm}}$ .

SOLUTION.

PROBLEM 2.10. Let u and v be harmonic functions in the unit ball  $B_1 \subset \mathbb{R}^n$ . What can you conclude about u and v if

- (a)  $D^{\alpha}u(0) = D^{\alpha}v(0)$  for every multiindex  $\alpha$ ?
- (b)  $u(x) \leq v(x)$  for every  $x \in B_1$  and u(0) = v(0)?

Justify your answer in each case.

SOLUTION.

PROBLEM 2.11. Let  $\Phi$  be the fundamental solution of the Laplace equation in  $\mathbb{R}^n$  and  $f \in C_0^{\infty}(\mathbb{R}^n)$ . Then the convolution

$$u(x) := (\Phi * f)(x) = \int_{\mathbb{R}^n} \Phi(x - y) f(y) \, dy$$

is a solution to the Poisson equation  $-\Delta u = f$  in  $\mathbb{R}^n$ . Show that if f is radial, i.e., f(y) = f(|y|), and supported in  $B_R := \{ |x| < R \}$ , then

$$u(x) = c\Phi(x)$$

for any  $x \in \mathbb{R}^n \setminus B_R$ , where

$$c = \int_{\mathbb{R}^n} f(y) \, dy.$$

[Hint: Use polar (spherical) coordinates and apply the mean value property for harmonic functions.] Solution.

# 3 Qualifying Exams

# 3.1 Qualifying Exam, August '04

PROBLEM 3.1. Consider the initial value problem

$$\begin{cases} a(x,y)u_x + b(x,y)u_y = -u, \\ u = f & \text{on } S^1 = \{x^2 + y^2 = 1\}, \end{cases}$$

where a and b satisfy

$$a(x,y) + b(x,y)y > 0$$

for any  $x, y \in \mathbb{R}^n \setminus \{(0,0)\}.$ 

- (a) Show that the initial value problem has a unique solution in a neighborhood of  $S^1$ . Assume that a, b, and f are smooth.
- (b) Show that the solution of the initial value problem actually exists in  $\mathbb{R}^2 \setminus \{(0,0)\}$ .

SOLUTION.

PROBLEM 3.2. Let  $u \in C^2(\mathbb{R} \times [0,\infty))$  be a solution of the initial value problem for the onedimensional wave equation

$$\begin{cases} u_{tt} - u_{xx} = 0 & \text{on } \mathbb{R} \times (0, \infty), \\ u = f, & u_t = g & \text{in } \mathbb{R} \times 0, \end{cases}$$

where f and g have compact support. Define the kinetic energy by

$$K(t) = \frac{1}{2} \int_{-\infty}^{\infty} u_t^2(x, t) dx,$$

and the potential energy by

$$P(t) = \frac{1}{2} \int_{-\infty}^{\infty} u_x^2(x, t) dx.$$

Show that

- (a) K(t) + P(t) is constant in t,
- (b) K(t) = P(t) for all large enough times t.

SOLUTION.

PROBLEM 3.3. Use Kirchhoff's formula and Duhamel's principle to obtain an integral representation of the solution of the following Cauchy problem

$$\begin{cases} u_{tt} - \Delta u = e^{-t}g(x) & \text{for } x \in \mathbb{R}^3, t > 0, \\ u(x,0) = u_t(x,0) = 0 & \text{for } x \in \mathbb{R}^3. \end{cases}$$

Verify that the integral representation reduces to the obvious solution  $u = e^{-t} + t - 1$  when g(x) = 1.

SOLUTION.

PROBLEM 3.4. Let  $\Omega$  be a bounded open set in  $\mathbb{R}^n$  and  $g \in C_0^{\infty}(\Omega)$ . Consider the solutions of the initial boundary value problem

$$\begin{cases} \Delta u - u_t = 0 & \text{for } x \in \Omega, \, t > 0, \\ u(x,0) = g(x) & \text{for } x \in \Omega, \\ u(x,t) = 0 & \text{for } xi \in \partial \Omega, \, t \geq 0, \end{cases}$$

and the Cauchy problem

$$\begin{cases} \Delta v - v_t = 0 & \text{for } x \in \mathbb{R}^n, \ t > 0, \\ v(x, 0) = |g(x)| & \text{for } x \in \mathbb{R}^n, \end{cases}$$

where we put g = 0 outside  $\Omega$ .

(a) Show that

$$-v(x,t) \le u(x,t) \le v(x,t)$$

for any  $x \in \Omega$ , t > 0.

(b) Use (a) to conclude that

$$\lim_{t \to \infty} u(x, t) = 0,$$

for any  $x \in \Omega$ .

SOLUTION.

PROBLEM 3.5. Let  $P_k(x)$  and  $P_m(x)$  be homogeneous harmonic polynomials in  $\mathbb{R}^n$  of degrees k and m respectively; i.e.,

$$P_k(\lambda x) = \lambda^k P_k(x), \qquad P_m(\lambda x) = \lambda^m P_m(x),$$

for any  $x \in \mathbb{R}^n$ ,  $\lambda > 0$ ,

$$\Delta P_k = 0, \qquad \Delta P_m = 0$$

in  $\mathbb{R}^n$ .

(a) Show that

$$\frac{\partial P_k(x)}{\partial \nu} = kP_k(x), \qquad \frac{\partial P_m(x)}{\partial \nu} = mP_m(x)$$

on  $\partial B_1$ , where  $B_1 = \{ |x| < 1 \}$  and  $\nu$  is the outward normal on  $\partial B_1$ .

(b) Use (a) and Green's second identity to prove that

$$\int_{\partial B_1} P_k(x) P_m(x) \, dS = 0,$$

if  $k \neq m$ .

## 3.2 Qualifying Exam, August '05

Problem 3.6.

(a) Find a solution of the Cauchy problem

$$\begin{cases} yu_x + xu_y = xy, \\ u = 1 & \text{on } S^1 = \{ x^2 + y^2 = 1 \}. \end{cases}$$

(b) Is the solution unique in a neighborhood of the point (1,0)? Justify your answer.

SOLUTION. The solution to teh first part is

$$u(x,y) = \frac{x^2 + y^2}{4} + \frac{3}{4}.$$

PROBLEM 3.7. Consider the second order PDE in  $\{x > 0, y > 0\} \subset \mathbb{R}^2$ 

$$x^2 u_{xx} - y^2 u_{yy} = 0.$$

- (a) Classify the equation and reduce it to the canonical form.
- (b) Show that the general solution of the equation is given by the formula

$$u(x,y) = F(x,y) + \sqrt{xy}G(x/y).$$

SOLUTION.

PROBLEM 3.8. Let  $\Phi$  be the fundamental solution of the Laplace equation in  $\mathbb{R}^3$  and  $f \in C_0^{\infty}(\mathbb{R}^n)$ . Then the convolution

$$u(x) := (\Phi * f)(x) = \int_{\mathbb{R}^n} \Phi(x - y) f(y) \, dy$$

is a solution of the Poisson equation  $-\Delta u = f$  in  $\mathbb{R}^n$ . Show that if f is radial (i.e., f(y) = f(|y|)) and supported in  $B_R = \{ |x| < R \}$ , then

$$u(x) = c\Phi(x),$$

for any  $x \in \mathbb{R}^n \setminus B_R$ , where

$$c = \int_{\mathbb{R}^n} f(y) \, dy.$$

[Hint: Use spherical (polar) coordinates and the mean value property.]

PROBLEM 3.9. Consider the so-called 2-dimensional wave equation with dissipation

$$\begin{cases} u_{tt} - \Delta u + \alpha u_t = 0 & \text{in } \mathbb{R}^2 \times (0, \infty), \\ u(x, 0) = g(x), & u_t(x, 0) = h(x) & \text{for } x \in \mathbb{R}^2, \end{cases}$$

where  $g, h \in C_0^{\infty}(\mathbb{R}^2)$  and  $\alpha \geq 0$  is a constant.

(a) Show that for an appropriate choice of constant  $\lambda$  and  $\mu$  the function

$$v(x_1, x_2, x_3, t) := e^{\lambda t + \mu x_3} u(x_1, x_2, t)$$

solves the 3-dimensional wave equation  $v_{tt} - \Delta v = 0$ .

(b) Use (a) to prove the following domain of dependence result: for any point  $(x_0, t_0) \in \mathbb{R}^2 \times (0, \infty)$  the value  $u(x_0, t_0)$  is uniquely determined by values of g and h in  $\overline{B_{t_0}(x_0)} := \{ |x - x_0| \le t_0 \}$ . (You may use the corresponding result for the wave equation without proof.)

SOLUTION.

PROBLEM 3.10. Let u(x,t) be a bounded solution of the heat equation  $u_t = u_{xx}$  in  $\mathbb{R} \times (0,\infty)$  with the initial condition

$$u(x,0) = u_0(x)$$

for  $x \in \mathbb{R}$ , where  $u_0 \in C^{\infty}$  is  $2\pi$ -periodic, i.e.,  $u_0(x+2\pi) = u_0(x)$ . Show that

$$\lim_{t \to \infty} u(x, t) = a_0,$$

uniformly in  $x \in \mathbb{R}$ , where

$$a_0 := \frac{1}{2\pi} \int_0^{2\pi} u_0(x) \, dx.$$

# 3.3 Qualifying Exam, January '14

PROBLEM 3.11. Consider the first order equation in  $\mathbb{R}^2$ 

$$x_2 u_{x_1} + x_1 u_{x_2} = 0.$$

- (a) Find the characteristic curves of the equation.
- (b) Consider the Cauchy problem for this equation prescribed on the line  $x_1 = 1$ :

$$u(1, x_2) = f(x_2).$$

Find a necessary condition on f so that the proble is solvable in a neighborhood of the point (1,0).

Solution.

PROBLEM 3.12. Let u be a continuous bounded solution of the initial value problem for the Laplace equation

$$\begin{cases} \Delta u = 0 & \text{in } \{x_n > 0\}, \\ u(x', 0) = g(x') & \text{for } x' \in \mathbb{R}^{n-1}, \end{cases}$$

where g is a continuous function with compact support in  $\mathbb{R}^{n-1}$ . Here  $n \geq 2$ . Prove that

$$u(x) \longrightarrow 0,$$
 as  $|x| \longrightarrow \infty$ ,

for  $x \in \{x_n > 0\}$ .

SOLUTION.

PROBLEM 3.13. Let u be a bounded solution of the heat equation

$$\Delta u - u_t = 0$$
 in  $\mathbb{R} \times (0, \infty)$ ,

with the initial conditions u(x,0) = g(x), where g is a bounded continuous function on  $\mathbb{R}$  satisfying the Hölder condition

$$|g(x) - g(y)| \le M|x - y|^{\alpha}, \quad x, y \in \mathbb{R}$$

with a constant  $\alpha \in (0,1]$ . Show that

$$|u(x,t) - u(y,t)| \le M|x - y|^{\alpha}, \quad x, y \in \mathbb{R}, t > 0,$$
  
 $|u(x,t) - u(x,s)| \le C_{\alpha}M|t - s|^{\alpha/2}, \quad x \in \mathbb{R}, t, s > 0.$ 

[Hint: For the last inequality, in the representation formula of u(x,t) as a convolution with the heat kernel  $\Phi(y,t)$ , make a change of variables  $z=y/\sqrt{t}$  and use that  $|\sqrt{t}-\sqrt{s}| \leq \sqrt{|t-s|}$ .]

PROBLEM 3.14. Let u be a positive harmonic function in the unit ball  $B_1$  in  $\mathbb{R}^n$ . Show that

$$|D(\ln u)| \le M \qquad \text{in } B_{1/2}$$

for a constant M depending only on the dimension n.

[Hint: Use the interior derivative estimate  $|Du(x)| \leq (C_n/r) \sup_{B_r(x)} |u|$  for  $B_r(x) \subset B_1$  as well as the Harnack inequality for harmonic functions.]

SOLUTION.

PROBLEM 3.15. Let u be a  $C^2$  solution of the initial value problem

$$\begin{cases} u_{tt} - \Delta u = |x|^k & \text{in } \mathbb{R}^n \times (0, \infty), \\ u = 0, & u_t = 0 & \text{on } \mathbb{R}^n \times \{0\}. \end{cases}$$

for some  $k \geq 0$ . Prove that there exists a function  $\varphi(r)$  such that

$$u(x,t) = t^{k+2}\varphi(|x|/t).$$

[Hint: As one of the steps show that u is (k+2)-homogeneous in (x,t) variables, i.e.,  $u(\lambda x, \lambda t) = \lambda^{k+2} u(x,t)$  for any  $\lambda > 0$ .]
