CARLOS SALINAS PROBLEM 7.1

## Problem 7.1

Solve the Dirichlet problem for the Laplace equation in  $\mathbb{R}^2$ 

$$\begin{cases} \Delta u = 0 & \text{in } 1 < |x| < 2, \\ u = x_1 & \text{on } |x| = 1, \\ u = 1 + x_1 x_2 & \text{on } |x| = 2. \end{cases}$$

(Hint: Use Laurent series.)

SOLUTION. Suppose

$$u(r\cos\theta, r\sin\theta) = a_0 \ln r + \sum_{n\in\mathbb{Z}} a_n r^n \left(\cos(n\theta) + \sin(n\theta)\right)$$
 (7.1)

is a Laurent series solution to the Dirichlet problem above. Then, harmonicity implies that

$$0 = \Delta u$$

$$= u_{rr} + \frac{1}{r}u_r + \frac{1}{r^2}u_{\theta\theta}$$

$$= \sum_{n \in \mathbb{Z}} n(n-1)a_n r^{n-2}(\cos(n\theta) + \sin(n\theta))$$

$$+ \sum_{n \in \mathbb{Z}} na_n r^{n-2}(\cos(n\theta) + \sin(n\theta))$$

$$+ \sum_{n \in \mathbb{Z}} na_n r^{n-2}(-\sin(n\theta) + \cos(n\theta))$$

$$= \sum_{n \in \mathbb{Z}} r^{n-2}(n^2 a_n \cos(n\theta) + n(n-1)a_n \sin(n\theta)).$$

This implies that

$$0 = n^2 a_n \cos(n\theta) + n(n-1)a_n \sin(n\theta).$$

Hence,

$$a_n = -\frac{n(n-1)}{n^2} a_n \tan(n\theta)$$

CARLOS SALINAS PROBLEM 7.2

## Problem 7.2

Let  $\Omega$  be a bounded domain with a  $C^1$  boundary,  $g \in C^2(\partial \Omega)$  and  $f \in C(\bar{\Omega})$ . Consider the so called *Neumann problem* 

$$\begin{cases}
-\Delta u = f & \text{in } \Omega, \\
\frac{\partial u}{\partial \nu} = g & \text{on } \partial \Omega,
\end{cases}$$
(\*)

where  $\nu$  is the outer normal on  $\partial\Omega$ . Show that the solution of (\*) in  $C^2(\Omega) \cap C^1(\bar{\Omega})$  is unique up to a constant; i.e., if  $u_1$  and  $u_2$  are both solutions of (\*), then  $u_2 = u_1 + \text{const.}$  in  $\Omega$ . (*Hint:* Look at the proof of the uniqueness for the Dirichlet problem by energy methods [E, 2.2.5a].)

SOLUTION. Suppose  $u_1$  and  $u_2$  are solutions to the Neumann problem (\*). Define  $v:=u_1-u_2$ . Then v is harmonic in  $\Omega$  and  $\frac{\partial v}{\partial \nu}=0$  on  $\partial\Omega$ . Consider the energy functional

$$E[v] = \frac{1}{2} \int_{\Omega} |Dv|^2 dx.$$

By Green's formula version (ii),

$$\begin{split} E[v] &= \frac{1}{2} \int_{\Omega} |Dv|^2 \, dx \\ &= -\frac{1}{2} \int_{\Omega} v \Delta v \, dx + \int_{\partial U} \frac{\partial v}{\partial \nu} v \, dS(x) \\ &= 0. \end{split}$$

This implies that  $|Dv|^2 = Dv \cdot Dv = 0$  which, since the standard inner product on  $\mathbb{R}^n$  is positive-definite, implies that  $Dw \equiv 0$ . It follows that  $u_1 = u_2 + \text{const}$ , i.e., the solution u to (\*) is unique up to a constant.

CARLOS SALINAS PROBLEM 7.3

## Problem 7.3

Write down an explicit formula for a solution of

$$\begin{cases} u_t - \Delta u + cu = f & \text{in } \mathbb{R}^n \times (0, \infty), \\ u = g & \text{on } \mathbb{R}^n \times \{ t = 0 \}, \end{cases}$$

where  $c \in \mathbb{R}$ .

(*Hint:* Rewrite the problem in terms of  $v(x,t) := e^{ct}u(x,t)$ .)

SOLUTION.
