o.1 Danielli: Winter 2012

Problem 1. Let f(x,y), $0 \le x,y \le 1$, satisfy the following conditions: for each x, f(x,y) is an integrable function of y, and $\partial f(x,y)/\partial x$ is a bounded function of (x,y). Prove that $\partial f(x,y)/\partial x$ is a measurable function of y for each x and

$$\frac{d}{dx} \int_0^1 f(x, y) \, \mathrm{d}y = \int_0^1 \frac{\partial f(x, y)}{\partial x} \, \mathrm{d}y.$$

Solution. ▶

Problem 2. Let f be a function of bounded variation on [a, b], $-\infty < a < b < \infty$. If f = g + h, with g absolutely continuous and h singular, show that

$$\int_{a}^{b} \varphi \, \mathrm{d}f = \int_{a}^{b} \varphi f' \, \mathrm{d}x + \int_{a}^{b} \varphi \, \mathrm{d}h.$$

Hint: A function h is said to be singular if h' = 0.

Problem 3. Let $E \subset \mathbb{R}$ be a measurable set, and let K be a measurable function on $E \times E$. Assume that there exists a positive constant C such that

$$\int_{E} K(x, y) \, \mathrm{d}x \le C \tag{1}$$

for a.e. $y \in E$, and

$$\int_{E} K(x, y) \, \mathrm{d}y \le C \tag{2}$$

for a.e. $x \in E$.

Let $1 , <math>f \in L^p(E)$, and define

$$T_f(x) = \int_E K(x, y) f(y) \, \mathrm{d}y.$$

(a) Prove that $T_f \in L^p(E)$ and

$$||T_f||_p \le C||f||_p. (3)$$

(b) Is (3) still valid if p = 1 or ∞ ? If so, are assumptions (1) and (2) needed?

Solution. ▶

Problem 4. Let f be a nonnegative measurable function on [0,1] satisfying

$$|\{x \in [0,1] : f(x) > \alpha\}| < \frac{1}{1+\alpha^2}$$
 (4)

for $\alpha > 0$.

- (a) Determine values of $p \in [1, \infty)$ for which $f \in L^p[0, 1]$.
- (b) If p_0 is the minimum value of p for which p may fail to be in L^p , give an example of a function which satisfies (4), but which is not in $L^{p_0}[0,1]$.

o.2 Danielli: Summer 2011

Problem 1. Let $f \in L^1(\mathbb{R})$, and let $F(t) = \int_{\mathbb{R}} f(x) \cos(tx) dx$.

- (a) Prove that F(t) is continuous for $t \in \mathbb{R}$.
- (b) Prove the following *Riemman–Lebesgue lemma*:

$$\lim_{t\to\infty} F(t) = 0.$$

Hint: Start by proving the statement for $f = \chi_{[a,b]}$.

Solution. ▶

Problem 2. (a) Suppose that f_k , $f \in L^2(E)$, with E a measurable set, and that

$$\int_{E} f_{k}g \longrightarrow \int_{E} fg \tag{1}$$

as $k \to \infty$ for all $g \in L^2(E)$. If, in addition, $||f_k||_2 \to ||f||_2$ show that f_k converges to f in L^2 , i.e., that

$$\int_{E} |f - f_k|^2 \longrightarrow 0$$

as $k \to \infty$.

(b) Provide an example of a sequence f_k in L^2 and a function f in L^2 satisfying (1), but such that f_k does *not* converge to f in L^2 .

Solution. ▶

Problem 3. A bounded function f is said to be of bounded variation on \mathbb{R} if it is of bounded variation on any finite subinterval [a,b], and moreover $A=\sup_{a,b}V[a,b;f]<\infty$. Here, V[a,b;f] denotes the total variation of f over the interval [a,b]. Show that:

(a)
$$\int_{\mathbb{R}} |f(x+h) - f(x)| \, \mathrm{d}x \le A|h| \text{ for all } h \in \mathbb{R}.$$

Hint: For h > 0, write

$$\int_{\mathbb{R}} |f(x+h) - f(x)| \, \mathrm{d}x = \sum_{n = -\infty}^{\infty} \int_{nh}^{(n+1)h} |f(x+h) - f(x)| \, \mathrm{d}x.$$

(b) $\left| \int_{\mathbb{R}} f(x) \varphi'(x) \, \mathrm{d}x \right| \leq A$, where φ is any function of class C^1 , of bounded variation, compactly supported, with $\sup_{x \in \mathbb{R}} |\varphi(x)| \leq 1$.

Solution. ▶

Problem 4. (a) Prove the generalized Hölder's inequality: Assume $1 \le p \le \infty$, $j = 1, \ldots, n$, with $\sum_{j=1}^{\infty} 1/p_j = 1/r \le 1$. If E is a measurable set and $f_j \in L^{p_j}(E)$ for $j = 1, \ldots, n$, then $\prod_{j=1}^n f_j \in L^r(E)$ and

$$||f_1 \cdots f_n||_r \le ||f_1||_{p_1} \cdots ||f_n||_{p_n}.$$

(b) Use part (a) to show that that if $1 \le p, q, r \le \infty$, with 1/p + 1/q = 1/r + 1, $f \in L^p(\mathbb{R})$, and $g \in L^p(\mathbb{R})$, then

$$|(f * g)(x)| \le ||f||_p^{r-p} ||g||_q^{r-q} \int |f(y)|^p |g(x-y)|^q dy.$$

(Recall that $(f * g)(x) = \int f(y)g(x - y) dy$.)

(c) Prove *Young's convolution theorem*: Assume that p, q, r, f, and g are as in part (b). Then $f * g \in L^r(\mathbb{R})$ and

$$||f * g||_r \le ||f||_p ||g||_q.$$

1 Bañuelos

1.1 Bañuelos: Summer 2000

Problem 1. Let (X, \mathcal{F}, μ) be a measure space and suppose $\{f_n\}$ is a sequence of measurable functions with the property that for all $n \geq 1$

$$\mu(\{x \in X : |f_n(x)| \ge \lambda\}) \le C \exp(-\lambda^2/n)$$

for all $\lambda > 0$. (Here C is a constant independent of n.) Let $n_k = 2^k$. Prove that

$$\limsup_{k \to \infty} \frac{|f_{n_k}|}{\sqrt{n_k \log(\log(n_k))}} \le 1 \quad \text{a.e.}$$

Solution. \blacktriangleright Suppose $\{f_n\}_{n=1}^{\infty}$ is a sequence of measurable functions such that

$$\mu(\lbrace x \in X : |f_n(x)| \ge \lambda \rbrace) \le C \exp(-\lambda^2/n) \tag{1}$$

for all λ . Now, consider the subsequence $\{f_{2^k}\}_{k=1}^{\infty}$ of $\{f_n\}_{n=1}^{\infty}$. We aim to show that

$$\limsup_{k \to \infty} \frac{|f_{2^k}|}{\sqrt{2^k \log(\log(2^k))}} \le 1$$

almost everywhere. To that end, it suffices to show that the set

$$E = \left\{ x \in X : \limsup_{k \to \infty} \frac{|f_{2^k}|}{\sqrt{2^k \log(\log(2^k))}} > 1 \right\}$$

has measure zero. Let $x \in E$ then

$$\limsup_{k \to \infty} \frac{|f_{2^k}(x)|}{\sqrt{2^k \log(\log(2^k))}} > 1.$$

This means that there exists some subsequence $\{k_m\}_{m=1}^{\infty} \subset \{k\}_{n=1}^{\infty}$ such that

$$\lim_{m\to\infty}\frac{|f_{2^{k_m}}(x)|}{\sqrt{2^{k_m}\log(\log(2^{k_m}))}}>1.$$

This means that, for sufficiently large N

$$|f_{2^{k_n}}(x)| > \sqrt{2^{k_n} \log(\log(2^{k_n}))}$$

for all $n \ge N$. But by Equation (1) we have

$$\mu\left(\left\{x \in X : \frac{|f_{2^{k_n}}(x)|}{\sqrt{2^{k_n}\log(\log(2^{k_n}))}} \ge 1\right\}\right) \le C \exp\left(-\left(\sqrt{2^{k_n}\log(\log(2^{k_n}))}\right)^2 / 2^{k_n}\right)$$

$$= C \exp\left(-2^{k_n}\log(\log(2^{k_n})) / 2^{k_n}\right)$$

$$= C \exp\left(-\log(\log(2^{k_n}))\right)$$

$$= C \exp\left(\log(1/\log(2^{k_n}))\right)$$

$$= \frac{C}{\log(2^{k_n})}.$$
(2)

Letting $n \to \infty$, we see that the measure of the set on the left-hand side of Equation (2) must go to 0 so $\mu(E) = 0$.

Problem 2. Let (X, \mathcal{F}, μ) be a finite measure space. Let f_n be a sequence of measurable functions with $f_1 \in L^1(\mu)$ and with the property that

$$\mu(\{x \in X : |f_n(x)| > \lambda\}) \le \mu(\{x \in X : |f_1(x)| > \lambda\})$$

for all *n* and all $\lambda > 0$. Prove that

$$\lim_{n\to\infty}\frac{1}{n}\int_X\left[\max_{1\leq j\leq n}|f_j|\right]\mathrm{d}\mu=0.$$

[*Hint*: You may use the fact that $||f||_1 = \int_0^\infty \mu(\{|f(x)| > \lambda\}) \, d\lambda.]$

Solution. \blacktriangleright Define $g_n, h_n \colon \mathcal{F} \to [0, \infty]$ for $n \in \mathbb{N}$ by

$$g_n(\lambda) = \mu(\lbrace x \in X : |f_n(x)| > \lambda \rbrace), \quad h_n(\lambda) = \mu(\lbrace x \in X : \max_{1 \le i \le n} |f_i(x)| > \lambda \rbrace).$$

Now, note that, by the monotonicity of μ , we have

$$h_n(\lambda) \leq \sum_{i=1}^n g_n(\lambda) \leq ng_1(\lambda).$$

Thus,

$$\frac{h_n(\lambda)}{n} \le g_1(\lambda).$$

Since $||f_1||_1 = \int_0^\infty g_1(\lambda) \, d\lambda$, by Lebesgue's dominated convergence theorem, we have

$$\lim_{n \to \infty} \frac{1}{n} \int_{X} \left[\max_{1 \le j \le n} |f_{j}| \right] d\mu = \lim_{n \to \infty} \int_{X} \frac{h_{n}(x)}{n} d\mu$$

$$= \int_{X} \lim_{n \to \infty} \frac{h_{n}(x)}{n} d\mu$$

$$\leq \int_{X} \lim_{n \to \infty} \frac{\mu(X)}{n}$$

$$= 0$$

as we wanted to show.

Problem 3.

- (i) Let (X, \mathcal{F}, μ) be a finite measure space. Let $\{f_n\}$ be a sequence of measurable functions. Prove that $f_n \to f$ is measurable if and only if every subsequence $\{f_{n_k}\}$ contains a further subsequence $\{f_{n_{k_j}}\}$ that converges a.e. to f.
- (ii) Let (X, \mathcal{F}, μ) be a finite measure space. Let $F \colon \mathbb{R} \to \mathbb{R}$ be continuous and $f_n \to f$ in measure. Prove that $F(f_n) \to F(f)$ in measure. (You may assume, of course, that f_n , F, $F(f_n)$, and F(f) are all measurable.)

Solution. ▶ Recall that a sequence of measurable functions $\{f_n\}$ converge in measure to a limit f if for every $\varepsilon > 0$ the limit

$$\lim_{n\to\infty} \mu(\{x\in X: |f(x)-f_n(x)|\geq \varepsilon\})=0.$$

For part (i) \implies suppose that $f_n \to f$ in measure. Then given $\varepsilon > 0$ and $\delta > 0$ there exists $N \in \mathbb{N}$ such that $n \ge N$ implies

$$\mu(\{x \in X : |f(x) - f_n(x)| \ge \varepsilon\}) < \delta.$$

In particular, given $\varepsilon=k^{-1}$ and $\delta=2^{-k}$, consider the countable collection of measurable sets $\{E_k\}_{k=1}^{\infty}$ given by

$$E_k = \left\{ x \in X : |f(x) - f_{n_k}(x)| \ge \frac{1}{k} \right\},\,$$

where $n_k \ge N(k)$ (which depends on our choice of k) such that

$$\mu(E_k) < \frac{1}{2^k}.$$

Now, by the Borel-Cantelli lemma, since

$$\sum_{k=1}^{\infty} \mu(E_k) < \sum_{k=1}^{\infty} 2^{-k} = 1 < \infty,$$

for almost every $x \in X$, there exists $N_x \in \mathbb{N}$ such that $x \notin E_k$ for $k \ge N_x$. This means that for $k \ge N_x$, we have

$$|f(x)-f_{n_k}(x)|<\frac{1}{k}.$$

Let $\{f_{n_{k+1}}\}$ be the subsequence of $\{f_{n_k}\}$. Then

$$\lim_{k \to \infty} f_{n_{k+1}} = f$$

as desired.

 \Leftarrow On the other hand, suppose that every subsequence $\{f_{n_k}\}$ of $\{f_n\}$ contains a subsequence $\{f_{n_{k_j}}\}$ that converges to f. Seeking a contradiction, suppose that given $\varepsilon > 0$ there exists a subsequence $\{f_{n_k}\}$ of $\{f_n\}$ such that

$$M=\mu\bigl(\bigl\{\,x\in X:|f(x)-f_{n_k}(x)|\geq\varepsilon\,\bigr\}\bigr)>0.$$

But by assumption there exists a subsequence $\{f_{n_{k_j}}\}$ of $\{f_{n_k}\}$ that converges almost everywhere to f. We claim that this implies that $f_{n_{k_j}} \to f$ in measure.

Proof of claim. This is adapted from a proof in Royden, Proposition 3, Ch. 5.

First note that f is measurable since it is the pointwise limit almost everywhere of a sequence of measurable functions. Let $\varepsilon, \delta > 0$ be given. Here is where the assumption that $\mu(X) < \infty$ is essential! By Egorov's theorem, there is a measurable subset $E \subset X$ with $\mu(X \setminus E) < \delta$ such that $f_n \to f$ uniformly on E. Thus, there is an index N such that $n \geq N$ implies

$$|f_n(x) - f(x)| < \varepsilon$$

for all $x \in E$. Thus, for $n \ge N$,

$$\{x \in X : |f(x) - f_n(x)| \ge \varepsilon\} \subset X \setminus E$$

so

$$\mu(\{x \in X : |f(x) - f_n(x)| \ge \varepsilon\}) < \varepsilon.$$

Thus, we have

$$\lim_{n\to\infty} \mu(\{x\in X: |f(x)-f_n(x)|\geq \varepsilon\})=0,$$

i.e., $f_n \to f$ in measure.

Hence, since $f_{n_k} \to f$ in measure, but M > 0 we have a contradiction.

For (ii) since F is continuous given $\varepsilon > 0$ there exist $\delta > 0$ such that $|x - x'| < \delta$ implies $|F(x) - F(x')| < \varepsilon$. By part (i), $f_n \to f$ in measure if and only if every subsequence $\{f_{n_k}\}$ of $\{f_n\}$ contains a subsequence $\{f_{n_{k_j}}\}$ that converges to f almost everywhere, i.e., given $\delta > 0$ there exists an index N such that $n_{k_j} \geq N$ implies

$$|f(x) - f_{n_{i}}(x)| < \delta$$

for almost every $x \in X$. Thus,

$$\left| F(f(x)) - F(f_{n_{j_k}}(x)) \right| < \varepsilon$$

and we see that for every subsequence $\{F \circ f_{n_k}\}$ of $\{F \circ f_n\}$ we can find a subsequence $\{F \circ f_{n_{j_k}}\}$ that converges almost everywhere to $F \circ f$.

Problem 4. Let (X, \mathcal{F}, μ) be a finite measure space and suppose $f \in L^1(\mu)$ is nonnegative. Suppose $1 and let <math>1 < q < \infty$ be its conjugate exponent, i.e., 1/p + 1/q = 1. Suppose f has the property that

$$\int_{E} f \, \mathrm{d}\mu \le \mu(E)^{1/q}$$

for all measurable sets E. Prove that $f \in L^r(\mu)$ for any $1 \le r < p$. [*Hint*: Consider $\{x \in X : 2^n \le f(x) < 2^{n+1}\}$, if you like.]

Solution. ▶ By previous problems, we know that if $\mu(X) < \infty$ and $f \in L^p(X)$, then $f \in L^r(X)$ for $1 \le r < p$, so it suffices to show that $||f||_p < \infty$.

Instead of following the hint, consider the set

$$E_t = \{ x \in X : f(x) \ge t \}$$

and let

$$\omega(t) = \mu(E_t)$$
.

i.e., the distribution function of f. Then, we have

$$\int_0^\infty \omega(t) \, \mathrm{d}t = \int_X f \, \mathrm{d}\mu.$$

In particular, if we make the substitution $\alpha = t^{1/p}$, $d\alpha = t^{1/q}/p \, dt = \alpha^{p/q}/p \, dt$, we have

$$\int_X f^r d\mu = \int_0^\infty p\alpha^{-p/q} \omega(\alpha) d\alpha.$$

Now, by Chebyshev's inequality, we have

$$t\omega(t) \le \int_{E_t} f \,\mathrm{d}\mu \le \omega(t)^{1/q}$$

so

$$\omega(t) \leq t^{-p}$$
.

Thus,

$$\int_X f^r \, \mathrm{d}\mu = \int_0^\infty p\alpha^{-p/q} \omega(\alpha) \, \mathrm{d}\alpha \le \int_0^\infty p\alpha^{-p-p/q} \, \mathrm{d}\alpha.$$

Since p + p/q > 1, the integral above is finite. Thus, $f \in L^p(X)$ and we have $f \in L^r(X)$ for all $1 \le r < p$.

Problem 5. Let f be a continuous function on [-1, 1]. Find

$$\lim_{n \to \infty} \int_{-1/n}^{1/n} f(x) (1 - n|x|) \, \mathrm{d}x.$$

Solution. ► To find the limit of the integral

$$\int_{-1/n}^{1/n} f(x)(1 - n|x|) \, \mathrm{d}x$$

we first make the following substitutions: Let y = nx, dy = n dx. Then

$$\int_{-1/n}^{1/n} f(x)(1-n|x|) \, \mathrm{d}x = \frac{1}{n} \int_{-1}^{1} f(y/n)(1-|y|) \, \mathrm{d}y.$$

By the extreme value theorem, since f is continuous and [-1,1] is compact f is bounded on [-1,1] by, say M. Let g(x)=M. Then $g\in L^1(X)$ since $\|g\|_1=2M$. Thus, by the Lebesgue dominated convergence theorem, since

$$|f(y/n)(1-|y|)| \le M$$

on [-1, 1] and $g \in L^1([-1, 1])$ it follows that

$$\lim_{n \to \infty} \int_{-1/n}^{1/n} f(x)(1 - n|x|) dx = \lim_{n \to \infty} \frac{1}{n} \int_{-1}^{1} f(y/n)(1 - |y|) dy$$
$$= \int_{-1}^{1} \lim_{n \to \infty} \left[\frac{f(y/n)(1 - |y|)}{n} \right] dy$$
$$= \int_{-1}^{1} \lim_{n \to \infty} \left[\frac{f(y/n)}{n} - \frac{|y|}{n} \right] dy$$
$$= 0.$$

Problem 6. Let (X, \mathcal{F}, μ) be a measure space and suppose $f \in L^p(\mu)$, $1 \le p < \infty$. Suppose E_n is a sequence of measurable sets satisfying $\mu(E_n) = 1/n$ for all n. Prove that

 $\lim_{n\to\infty} \left[n^{(p-1)/p} \int_{E_n} |f| \,\mathrm{d}\mu \right] = 0.$

Solution. \blacktriangleright The result follows immediately by Hölder's inequality. Let $C = ||f||_p$. Since $f \in L^p(X)$, then $f \in L^p(E_n)$ for all $n \in \mathbb{N}$. Thus, by Hölder's inequality

$$||f||_{L^{1}(E_{n})} \leq ||f||_{L^{p}(E_{n})} \mu(E)^{1/q}$$

$$\leq C\mu(E)^{1/q}$$

$$= C\mu(E)^{p/(p-1)}$$

$$= Cn^{-p/(p-1)}$$

$$= Cn^{p/(1-p)}.$$

Hence, the integral is bounded above by

$$0 \le n^{(p-1)/p} \int_{E_n} |f| \, \mathrm{d}\mu \le C n^{(p-1)/p + p/(1-p)}$$
$$= C n^{(2p-1)/(p(1-p))}.$$

Since p > 1, 1 - p < 0 and 2p - 1 > 0 so the exponent (2p - 1)/(p(1 - p)) < 0. Thus, as $n \to \infty$

$$Cn^{(2p-1)/(p(1-p))} \longrightarrow 0.$$

It follows that

$$\lim_{n\to\infty} \left[n^{(p-1)/p} \int_{E_n} |f| \,\mathrm{d}\mu \right] = 0.$$

Problem 7. Let (X, \mathcal{M}, μ) be a measure space and let $\{g_n\}$ be a sequence of nonnegative measurable functions with the property that $g_n \in L^1(\mu)$ for every n and $g_n \to g$ in $L^1(\mu)$. Let $\{f_n\}$ be another sequence of nonnegative measurable functions on (X, \mathcal{F}, μ) .

(i) If $f_n \leq g_n$ almost everywhere for every n, prove that

$$\limsup_{n\to\infty} \int_X f_n \,\mathrm{d}\mu \le \int_X \limsup_{n\to\infty} f_n \,\mathrm{d}\mu.$$

[*Hint*: Start by considering a subsequence $\{f_{n_k}\}$ such that

$$\lim_{n_k \to \infty} \int_X f_{n_k} \, \mathrm{d}\mu = \limsup_{n \to \infty} \int_X f_n \, \mathrm{d}\mu$$

and let $\{g_{n_{k_j}}\}$ be a subsequence of $\{g_{n_k}\}$ such that $g_{n_{k_j}} \to g$ almost everywhere.]

(ii) If $f_n \to f$ almost everywhere and if $f_n \le g_n$ almost everywhere for all n, then $||f_n - f||_1 \to 0$ as $n \to \infty$.

Solution. \blacktriangleright Part (i) is a generalization of what is colloquially known as the reverse Fatou's lemma. Consider the sequence of measurable functions $\{h_n\}$ where $h_n=g_n-f_n$. Note that $h_n\geq 0$ for all $x\in X$ since $g_n\geq f$ for all $x\in X$. Мы говорим

Problem 8. Let $f \in L^1(\mathbb{R})$. Consider the function

$$F(x) = \int_{\mathbb{R}} \exp(ixt) f(t) dt.$$

- (i) Show that $F \in L^{\infty}(\mathbb{R})$ and that F is continuous at every $x \in \mathbb{R}$. Moreover, if $|t|^k f(t) \in L^{\infty}(\mathbb{R})$ for all $k \geq 1$, show that F is infinitely differentiable, i.e., $F \in C^{\infty}(\mathbb{R})$.
- (ii) Suppose f is continuous as well as in $L^1(\mathbb{R})$. Show that $\lim_{|x|\to\infty} F(x) = 0$.

[*Hint*: Using $\exp(-i\pi) = -1$, write $F(x) = \left(\int_{\mathbb{R}} (\exp(ixt) - \exp(ixt - i\pi)) \right) / 2$.]

1.2 Bañuelos: Summer 2000

Problem 1. For any two subsets *A* and *B* of \mathbb{R} define $A+B=\{a+b:a\in A,b\in B\}$.

- (i) Suppose A is closed and B is compact. Prove that A + B is closed.
- (ii) Give an example that shows that (i) may be false if we only assume that *A* and *B* are closed.

Solution. ▶

Problem 2. Suppose $f:[0,1] \to \mathbb{R}$ is differentiable at every $x \in [0,1]$ where by differentiability at 0 and 1 we mean right and left differentiability, respectively. Prove that f' is continuous if and only if f is uniformly differentiable. That is, if and only if for all $\varepsilon > 0$ there is an $h_0 > 0$ such that

$$\left| \frac{f(x+h) - f(x)}{h} - f'(x) \right| < \varepsilon$$

whenever $0 \le x, x + h \le 1, 0 < |h| < h_0$.

Solution. ▶

Problem 3. Let (X, \mathcal{F}, μ) be a measure space with $\mu(X) = 1$ and let F_1, \ldots, F_{17} be seventeen measurable subsets of X with $\mu(F_i) = 1/4$ for every j.

- (i) Prove that five of these subsets must have an intersection of positive measure. That is, if E_1, \ldots, E_k denotes the collection of all nonempty intersections of the F_j taken five at a time ($k \le 6188$), show that at least one of these sets must have positive measure.
- (ii) Is the conclusion in (i) true if we take sixteen sets instead of seventeen?

Solution. ▶

Problem 4. Let $f_n: X \to [0, \infty)$ be a sequence of measurable functions on the measure space (X, \mathcal{F}, μ) . Suppose there is a positive constant M such that the functions $g_n(x) = f(x)\chi_{\{f_n \le M\}}(x)$ satisfy $||g_n||_1 \le A/n^{4/3}$ and for which $\mu(\{x \in X : f_n(x) > M\}) \le B/n^{5/4}$, where A and B are positive constants independent of n. Prove that

$$\sum_{n=1}^{\infty} f_n < \infty$$

almost everywhere.

Solution. ▶

Problem 5. Let $\{g_n\}$ be a bounded sequence of functions on [0,1] which is uniformly Lipschitz. That is there is a constant M (independent of n) such that for all n, $|g_n(x) - g_n(y)| \le M|x - y|$ for all $x, y \in [0,1]$ and $|g_n(x)| \le M$ for all $x \in [0,1]$.

(i) Prove that for any $0 \le a \le b \le 1$,

$$\lim_{n \to \infty} \int_a^b g_n(x) \sin(2n\pi x) \, \mathrm{d}x = 0.$$

(ii) Prove that for any $f \in L^1[0,1]$,

$$\lim_{n\to\infty} \int_0^1 f(x)g_n(x)\sin(2n\pi x)\,\mathrm{d}x = 0.$$

Solution. ▶

Problem 6. Let $\{f_n\}$ be a sequence of nonnegative functions in $L^1[0,1]$ with the property that $\int_0^1 f_n(t) \, \mathrm{d}t = 1$ and $\int_{1/n}^1 f_n(t) \, \mathrm{d}t \le 1/n$ for all n. Define $h(x) = \sup_n f_n(x)$. Prove that $h \notin L^1[0,1]$.

1.3 Bañuelos: Winter 2007

Problem 1. Let $f: [0,1] \to \mathbb{R}$.

- (i) Define what it means for f to be absolutely continuous.
- (ii) Define what it means for f to be of bounded variation.
- (iii) Let V(f; 0, x) be the total variation of f on [0, x]. Prove that if f is absolutely continuous on [0, 1] so is V(f; 0, x).

Problem 2.

(i) Suppose that $f: [0,1] \to \mathbb{R}$ is nondecreasing with f(0) = 0 and f(1) = 1. For a > 0, let A be set of all $x \in (0,1)$ for which

$$\limsup_{h \to 0} \frac{f(x+h) - f(x)}{h} > a.$$

Prove that $m^*(A) < 1/a$, where m^* denotes the Lebesgue outer measure.

(ii) Prove that there is no Lebesgue measurable set A in [0, 1] with the property that $m(A \cap I) = m(I)/4$ for every interval I.

[*Hint*: Consider the function $f(x) = \chi_A(x)$.]

Solution. ►

Problem 3. Let $\{E_j\}_{j=1}^{\infty}$ be Lebesgue measurable sets in [0,1] and let $E=\bigcup_{j=1}^{\infty}E_j$ and suppose there is an $\varepsilon>0$ such that $\sum_{j=1}^{\infty}m(E_j)\leq m(E)+\varepsilon$.

(i) Show that for all measurable sets $A \subset [0, 1]$

$$\sum_{j=1}^{\infty} m(A \cap E_j) \le m(A \cap E) + \varepsilon.$$

(ii) Let *A* be the set of all $x \in [0, 1]$ which are in at least two of E'_j . Prove that $m(A) \le \varepsilon$.

Solution. ▶

Problem 4. Let (X, \mathcal{F}, μ) be a finite measure space. Let $f_n \colon X \to [0, \infty)$ be a sequence measurable functions and suppose that $||f_n||_p \le 1$, $1 , and that <math>f_n \to f$ almost everywhere. Prove

(i) $f \in L^p(\mu)$. (ii) $||f_n - f||_1 \to 0 \text{ as } n \to \infty$.

Solution. ►

Problem 5.

Solution. ▶

Problem 6.

1.4 Bañuelos: Winter 2013

Problem 1.

(a)

- (i) Define almost uniform convergence on the measure space (X, \mathcal{F}, μ) .
- (ii) Let f_n be a sequence of nonnegative measurable functions converging almost uniformly to the nonnegative function f. Prove that $\sqrt{f_n}$ converges almost uniformly to \sqrt{f} .

(b)

- (i) Suppose f_n has the property that $\int_X |f_n| d\mu \to 0$.
- (ii) Does it follow that $f_n \to 0$ almost everywhere? Justify your answer.
- (iii) Does it follow that $f_n \to 0$ almost uniformly? Justify your answer.

Solution. ▶

Problem 2. Let (X, \mathcal{F}, μ) be a measure space and let $1 \leq p \leq \infty$ and q be its conjugate exponent. Suppose $f_n \to f$ in L^p and $g_n \to g$ in L^q . Prove that $f_n g_n \to fg$ in L^1 .

Solution. ▶

Problem 3. Let $\{a_k\}$ be a sequence of positive numbers converging to infinity. Prove that the following limit exists

$$\lim_{k \to \infty} \int_0^\infty \frac{\exp(-x)\cos x}{a_k x^2 + (1/a_k)} \, \mathrm{d}x$$

and find it. Make sure to justify all steps.

Solution. ▶

Problem 4. Let (X, \mathcal{F}, μ) be σ -finite and f be measurable such that for all $\lambda > 0$

$$\mu(\{x \in X : |f(x)| > \lambda\}) \le \frac{20}{\lambda^p}$$

where 1 . Let*q*be the conjugate exponent of*p*. Prove that there is a constant*C*depending only on*p*such that

$$\int_{E} |f(x)| \, \mathrm{d}\mu \le Cm(E)^{1/q},$$

for all measurable sets E with $0 < \mu(E) < \infty$. (The inequality holds trivially when $\mu(E) = 0$ or $\mu(E) = \infty$.)

[*Hint*: Recall $\int_E |f(x)| d\mu = \int_0^\infty ? d\lambda$ and "break it" at the right place!]

Solution. ▶

Problem 5. Suppose $f: [0,1] \to \mathbb{R}$ is of bounded variation with $V(f;0,1) = \alpha$. For any $\beta > \alpha$, set

$$A = \left\{ x \in (0,1) : \limsup_{h \to 0} \frac{|f(x+h) - f(x)|}{|h|} > \beta \right\}.$$

Prove that for any $0 , <math>m(A) \le (\alpha/\beta)^p$, where m denotes the Lebesgue measure.

Solution. ▶

Problem 6. Let $f \in L^1(0,1)$ and for $x \in (0,1)$, define

$$h(x) = \int_{x}^{1} \frac{f(t)}{t} dt.$$

- (i) Prove that h is continuous on (0, 1).
- (ii) Show that

$$\int_0^1 h(t) dt = \int_0^1 f(t) dt.$$
