CARLOS SALINAS PROBLEM 10

**Problem 1.** Let X be a Hausdorff space and let A be a compact subset of X. Prove from the definitions that A is closed.

Proof.

**Problem 2.** Let X be a Hausdorff space and let A and B be disjoint compact subsets of X. Prove that there are open sets U and V such that U and V are disjoint,  $A \subset U$  and  $B \subset V$ .

Proof.

**Problem 3.** Prove the Tube Lemma: Let X and Y be topological spaces with Y compact, let  $x_0 \in X$ , and let N be an open set of  $X \times Y$  containing  $x_0 \times Y$ , then there is an open set W of X containing  $x_0$  with  $W \times Y \subset N$ .

Proof.

**Problem 4.** Show that if Y is compact, then the projection map  $X \times X \to X$  is a closed map.

Proof.

**Problem 5.** Let X be a compact space and suppose we are given a nested sequence of subsets  $C_1 \supset C_2 \supset \cdots$  with all  $C_i$  closed. Let U be an open set containing  $\bigcap C_i$ . Prove that there is an  $i_0$  with  $C_{i_0} \subset U$ .

Proof.

**Problem 6.** Let X be a compact space, and suppose there is a finite family of continuous functions  $f_i \colon X \to \mathbf{R}, \ i = 1, ..., n$  with the following property: given  $x \neq y$  in X there is an i such that  $f_i(x) \neq f_i(y)$ . Prove that X is homeomorphic to a subspace of  $\mathbf{R}^n$ .

Proof.

**Problem 7.** Let X be a compact metric space and let  $\mathcal{U}$  be a covering of X by open sets. Prove that there is an  $\varepsilon > 0$  such that, for each set  $S \subset X$  with diameter  $< \varepsilon$ , there is a  $U \in \mathcal{U}$  with  $S \subset U$ . (This fact is known as the "Lebesgue number lemma.")

Proof.

**Problem 8.** Let  $S^1$  denote the circle  $\{x^2 + y^2 = 1\}$  in  $\mathbb{R}^2$ . Define an equivalence relation on  $S^1$  by

$$(x,y) \sim (x',y') \iff (x,y) = (x',y') \text{ or } (x,y) = (-x',-y')$$

(you do not have to prove that this is an equivalence relation). Prove that the quotient space  $S^1/\sim$  is homeomorphic to  $S^1$ .

One way to do this is by using complex numbers.

Proof.

**Problem 9.** Let X be a nonempty compact Hausdorff space and let  $f: X \to X$  be a continuous function. Suppose f is 1-1. Prove that there is a nonempty closed set A with f(A) = A. (The hypothesis that f is 1-1 is not actually needed, but it makes the proof a little easier.)

 $MA571\ Homework\ 9$ 

CARLOS SALINAS PROBLEM 16

Proof.

**Problem 10.** Let  $\sim$  be the equivalence relation on  $\mathbf{R}^2$  defined by  $(x,y) \sim (x',y')$  if and only if there is a nonzero t with (x,y)=(tx',ty'). Prove that the quotient space  $\mathbf{R}^2/\sim$  is compact but not Hausdorff.

Proof.

**Problem 11.** Let X be a locally compact Hausdorff space. Explain how to construct the one-point compactification of X and prove that the space you construct is really compact (you do not have to prove anything else for this problem.)

Proof.

**Problem 12.** Show that if  $\prod_{n=1}^{\infty} X_n$  is locally compact (and each  $X_n$  is nonempty), then each  $X_n$  is locally compact and  $X_n$  is compact for all but finitely many n.

Proof.

**Problem 13.** Let X be a locally compact Hausdorff space, let Y be any space, and let the function space  $\mathcal{C}(X,Y)$  have the compact-open topology. Prove that the map

$$e: X \times \mathcal{C}(X,Y) \to Y$$

define by the equation e(x, f) = f(x) is continuous.

Proof.

**Problem 14.** Let I be the unit interval, and let Y be a path-connected space. Prove that any two maps from I to Y are homotopic.

Proof.

**Problem 15.** Let X be a topological space and  $f: [0,1] \to X$  any continuous function. Define  $\bar{f}$  by  $\bar{f}(t) = f(1-t)$ . Prove that  $f * \bar{f}$  is path-homotopic to the constant path at f(0).

Proof.

**Problem 16.** LEt X be a path-connected topological space and let  $x_0, x_1 \in X$ . Recall that any path  $\alpha$  from  $x_0$  to  $x_1$  gives an isomorphism  $\hat{\alpha}$  from  $\pi_1(X, x_0)$  to  $\pi_1(X, x_1)$  (you do not have to prove this.)

Suppose that for every pair of paths  $\alpha$  and  $\beta$  from  $x_0$  to  $x_1$  the isomorphisms  $\hat{\alpha}$  and  $\hat{\beta}$  are the same. Prove that  $\pi_1(X, x_0)$  is Abelian.

Proof.
